Telephone: (601) 689-7141
Facsimile: (601) 688-7100

1.2 Overview

The MOODS Data Management System (MDMS) provides access to the Master Oceanographic Observation Data Set (MOODS) which is maintained by the Naval Oceanographic Office (NAVOCEANO). The MDMS incorporates database technology in providing seamless access to parameter (temperature, salinity, soundspeed) vs. depth observational profile data. The MDMS is an interactive software application with a graphical user interface (GUI) that supports user control of MDMS functional capabilities.

1.3 Document Overview

The purpose of this document is to define and describe the structural framework and logical design of the software components/units which are integrated into the major computer software configuration item (CSCI) identified as MDMS, Version 1.0. The preliminary design is based on functional specifications and requirements identified in the governing Statement of Work prepared by the Naval Oceanographic Office (NAVOCEANO) and distributed as a request for proposal by the National Aeronautics and Space Administration (NASA). The content and format of this document are specified by Department of Defense (DOD)-STD 2167A (2.1).

Appendix A contains a glossary of terms used within this document. Appendix B is a listing of acronyms used within this document. The MDMS relational database specification is
Appendix D contains functional and design requirements for the MDMS relational database management system (RDBMS). Refer to Appendix E for a description of the MDMS development environment. Appendix F contains listings of relevant source code structures. Appendix G provides information about the MDMS configuration file.

2 REFERENCED DOCUMENTS

Note: The section(s) or subsection(s) of this document wherein a reference is cited appears as parenthetical information following each document listed in this section.

2.1. DOD-STD 2167A "Defense System Software Development", AMSC No. N4327, 29 Feb 88. (1.3)

3 PRELIMINARY DESIGN

3.1 CSCI Overview

The Master Oceanographic Observation Data Set (MOODS) Data Management System (MDMS), a stand-alone system, is the major Computer Software Configuration Item (CSCI) to be developed by this project. Functional requirements, as identified by the sponsor, were not defined in the context of a modular approach to software development. Therefore, the tasks necessary to fulfill the functional requirements have been divided among/assigned to the internal Computer Software Components (CSC) for accomplishment. The top-level (simplistic) MDMS architecture is illustrated in Figure 1.

There are three principle CSC's within the MDMS structure:

a. **CSC-1: Graphical User Interface (GUI)** - incorporates initialization, window management, user interface and display functionality;

b. **CSC-2: Data Management Module (DMM)** - provides functional data management using relational RDBMS technology;

c. **CSC-3: Data Administration Module (DAM)** - incorporates administrative control of the application and is inaccessible to the general user.
The only access to the MDMS is via the User-GUI external interface which supports 1) application initialization, 2) user control of the MDMS using interactive techniques, 3) response/feedback to the user in the form of data display (graphical or numerical) and status indicators, 4) indirect access to data contained in the MOODS database, and 5) indirect access to files and data that are not resident within the MOODS database. The DMM accesses the MOODS database and data/configuration files through its external interfaces. The Naval Environmental Operational Nowcast System (NEONS)(2.3) controls access to the external MOODS database and has been modified to accommodate specific storage and retrieval requirements of the MDMS.

3.1.1 CSCI Architecture

Figure 1 illustrates the MDMS top-level (simplistic) module and its external interface architecture.

![MDMS Architecture Diagram](image)

Figure 1. Top-level modular structure of the MOODS Data Management System (MDMS). The MDMS is the Computer Software Configuration Item (CSCI). There are three Computer Software Components (CSC).

3.1.1.1 CSC-1: Graphical User Interface (GUI). The MDMS GUI supports and manages the link between the user and the MDMS. Through the GUI, the user exercises all available MDMS control options. The MDMS provides displays to the user for interpretation and interactive response. The GUI is integrated with the following non-developmental software:

a. X-Windows (proprietary): Manages all controls and display windows. The X-Windows client/server model supports remote user access to the MDMS using network protocol via the UNIX operating system. X-Windows operation is explained in detail in reference 2.2.

b. Open Software Foundation (OSF) Motif Widget Toolkit (proprietary): Provides a widely accepted standard inventory of window components (widgets) that is pleasing to
the eye and easy to interpret. For more information on programming using the Motif Widget Toolkit, see reference 2.2.

c. UNIRAS ag/X Toolmaster (proprietary): Handles graphical representation and visualization of data displays. See reference 2.5 for detailed information concerning ag/X Toolmaster.

Functionally, the GUI:

a. Performs application initialization and event monitoring functions;
b. Exercizes direct, centralized control over the DMM and DAM;
c. Monitors activities of the DAM and the DMM and its database/file interfaces;
d. Intercepts, interprets and routes user interactive commands;
e. Serves as the agent for communications between the DMM and the DAM;
f. Provides status information and feedback to the user;
g. Provides the windowing environment for visualization of data, display of control elements and intercepting user interactive commands;
h. Receives and interprets user input via the keyboard or mouse pointing device;
i. Incorporates visualization routines to plot data displays for viewing by the user.

3.1.1.2 CSC-2: Data Management Module (DMM). The MDMS DMM is primarily tasked with managing access to and communications with the external MOODS RDBMS via its NEONS (modified) interface. The DMM communicates with the GUI to pass information from the database and external files. It communicates with the DAM to enable MOODS Database Administrator (MDBA) control over application configuration. When a data request is received from the GUI, the DMM notifies NEONS to retrieve the data from the MOODS database. When the data has been received, the DMM informs the GUI and passes its location in memory. The DMM also receives data management instructions from both the GUI (user) and the DAM (MDBA). In turn, through NEONS, the DMM translates these instructions into Structured Query Language (SQL) commands to the RDBMS. The DMM is also responsible for allocating the internal memory space for data retrieved from the database or data destined for database ingestion.

3.1.1.3 CSC-3: Data Administration Module (DAM). The MDMS DAM is responsible for managing MDBA functions within the MDMS. MDBA functions are not accessible to the general user. These functions include importing data into the database and updating of MDMS application tables (classification codes, data source codes, instrument types) which are then made available for user interaction within the GUI.

3.1.1.4 NEONS (modified). The MOODS database is accessed via a modified version of NEONS, which performs high level management of the MOODS database. The specific modifications to NEONS for the MDMS allow use of additional keys to support optimal database query and data retrieval from the MOODS primary database tables (which contain the actual data). The MOODS database is a relational database. NEONS includes both the structural model for the database and the applications programmer interface (library routines) required to access the MOODS database tables using the American National Standards Institute (ANSI) standard SQL. NEONS was developed by the Naval Research Laboratory, Monterey, CA. A detailed description of NEONS is available in the NEONS design document (2.3). NEONS employs the proprietary Empress (2.4) relational data management system (RDBMS) for low-level management of the MOODS database.
3.1.1.5 USER-GUI (USER/CSC-1) External Interface. The USER-GUI interface provides user control of the MDMS. The interface is implemented by means of a pointing device (mouse) which is employed by the user to pass signal instructions (events) to the application, and the keyboard which is used to pass text information to the application.

3.1.1.6 GUI-DMM (CSC-1/CSC-2) Internal Interface. The GUI-DMM internal interface consists of all facilities for communication between the GUI and the DMM. The GUI-DMM interface is an abstraction employed to group those actions which pass information between the two modules. Actual communication between the GUI and the DMM is usually accomplished directly by the GUI and DMM functions involved.

3.1.1.7 GUI-DAM (CSC-1/CSC-3) Internal Interface. The GUI-DAM internal interface consists of all facilities for communication between the GUI and the DAM. The GUI-DAM interface embodies the same functionality and abstract character as the GUI-DMM interface.

3.1.1.8 DMM-DAM (CSC-2/CSC-3) Internal Interface. There are only two instances where the DMM and DAM communicate directly with each other. These instances are discussed in Section 4.2.2. Otherwise, the DMM and DAM communicate indirectly via the GUI.

3.1.1.9 DMM-NEONS External Interface. The DMM-NEONS external interface consists of all NEONS library functions that are integrated within the MDMS. These functions generate SQL commands to the Empress RDBMS, returning status indicators and performing two-way data transferal, when successfully executed.

3.1.1.10 DMM-FILES External Interface. The DMM-FILES external interface consists of all functions within the DMM which result in direct reading from or writing to files within the operating system's file management facility.

3.1.2 System States and Modes

The MDMS is an interactive software application. The application is always in an event-driven state. As with all event-driven software applications, the MDMS may assume either of two execution states (modes): (1) processing mode and (2) rest (idle) mode. The MDMS default state is the rest mode. When not processing data in response to user input, the application automatically reverts to the rest mode (event monitoring loop) and awaits the next user command or input.

3.1.3 Memory and Processing Time Allocation

The interactive, event-driven nature of the MDMS precludes a quantitative description of memory allocation and processing time among MDMS CSC's. It is therefore considered sufficient to state that the MDMS responds to user-generated commands by allocating memory, swap space and processor time within the limitations imposed by available memory, process loading and UNIX operating system constraints.

3.2 CSCI Design Description

The CSCI (MDMS) consists of three CSC modules with functionality as described above. Functional requirements for the CSCI, as stated by the sponsor, could not always be accomplished wholly and completely within a single CSC. For instance, the final display of profile data requires the cooperative contribution of both the GUI and the DMM modules. The remainder of this section identifies MDMS requirements, by CSC, and describes the software design employed to achieve
the required functionality. The CSCI incorporates all MDMS functional requirements (MFR) and design requirements (MDR) as presented in Section 7 of this document. In addition, the CSCI achieves specific design requirements which are not accomplished by any CSC (MDR1 through MDR4).

3.2.1 Graphical User Interface (GUI) (CSC-1)

CSC-1 is responsible for providing the visual display link between the user and the MDMS main interactive display. The design for the MDMS main interactive display window is illustrated in Figure 2. The GUI is the ultimate destination of all visible computational results achieved by the CSCI and its subordinate CSC’s. The DMM (CSC-2) performs data management chores for the GUI and DAM. The DAM (CSC-3) performs MDBA applications control and maintenance functions. The GUI and its subordinate components achieve the following specific functional and design requirements, either wholly or in concert with other CSC’s (see Section 7):

MDMS Functional Requirements (MFR)

MFR1, MFR2, MFR3, MFR4, MFR5, MFR6, MFR7, MFR8, MFR9, MFR10 MFR11, MFR12, MFR13, MFR14, MFR15, MFR17, MFR18, MFR19, MFR20, MFR21, MFR22, MFR23, MFR24, MFR26, MFR30, MFR32, MFR33.

MDMS Design Requirements (MDR)

MDR8
Figure 2. Illustration of the MDMS Graphical User Interface (GUI) (CSC-1) display screen. The GUI is the origin and final destination for all interactive coordination between the user and user-controllable processes resident in the Data Management Module (DMM) (CSC-2), the Data Administration Module (DAM) (CSC-3) and their internal/external interfaces.

3.2.2 Data Management Module (DMM) (CSC-2)

The Data Management Module (DMM) (CSC-2) controls the acquisition and distribution of data within the MDMS CSC1. The user has no direct interaction with the DMM. The DMM and its sub-level components achieve the following specific functional and design requirements, either wholly or in concert with other CSC’s (see Section 7):

MDMS Functional Requirements (MFR)

MFR13, MFR14, MFR15, MFR17, MFR18, MFR19, MFR20, MFR21, MFR22, MFR23, MFR24, MFR27, MFR28, MFR29, MFR30, and MFR31.

MDMS Design Requirements (MDR)
3.2.3 Data Administration Module (DAM) (CSC-3)

The DAM provides tools that enable application maintenance by the MDBA. There are no specific design requirements for the DAM. The DAM and its sub-level components achieve the following specific functional requirements, either wholly or in concert with other CSC's (see Section 7):

MDMS Functional Requirements (MFR)

MFR12, MFR13, and MFR15.

4 DETAILED DESIGN

Figure 3 illustrates the functional connectivity within the MDMS and forms the basis for the detailed design of the MDMS CSCI. The preliminary design (see Section 3) provides a broad overview of the framework and functional design of the MDMS CSCI and its three major CSC’s [Graphical User Interface (GUI), Data Management Module (DMM) and Data Administration Module (DIM)]. In this section, each CSC and its computer software units (CSU) will be described in greater detail.
4.1 CSC-1 - The MDMS Graphical User Interface (GUI)

The MDMS GUI (CSC-1) embodies all facilities for user interaction. Functions performed by the GUI include:

a. Application initialization;
b. Event monitoring;
c. Window management;
d. Communicating with the user and the Data Management and Data Administration modules;
e. Creation and display of data plots from data received from the DAM;
f. Processing and interpretation of user commands via the pointing device (mouse) and the keyboard;
g. Providing visual feedback in response to user input and internal messages;
g. Management of the user “Help” facility;
g. Application shutdown.

Figure 3. MDMS detail design and connectivity.
4.1.1 Initialization

The Initialization CSU receives control when the operating system releases control to the application. Functions performed by the Initialization CSU include:

a. Parsing and interpreting any command line arguments that identify the default configuration filename by the function `parseArg();`
b. Establishing a connection to the X server, initializing the Intrinsics layer and obtaining a TopLevelShell widget by the function `XtInitialize();`
c. Obtaining pointers to the Xlib Display and Screen structures using the functions `XtDisplay()` and `XtScreen();`
d. Reading the MOODS configuration file;
e. Opening the database using the `db_start()` function;
f. Creation and display of the MDMS Main Window, its window tree and data structures including default range values obtained from the configuration file via the function `CreateTree();`
g. Initializing internal MOODS data structures via function `InitMoodsStruct();`
h. Establishing user access privileges.
i. Executing the `XtMainLoop()` event monitoring function which dispatches all subsequent events to registered event handlers and/or callback functions.

4.1.1.1 MDMS Initialization Specification/Constraints

The design criteria for the MDMS Initialization CSU are listed in Section 7, “Requirements Traceability”. This CSU is constrained by the following software-specific requirements:

a. X-Windows and OSF Motif must be installed and accessible;
b. The Empress RDBMS must be installed and accessible;
c. UNIRAS ag/X Toolmaster must be installed and accessible;
d. NEONS must be installed and accessible;
e. A MOODS database must be available.

4.1.1.2 MDMS Initialization Design

The MDMS Initialization design adopts the standard X-Windows/OSF Motif protocol. The `XtMainLoop()` function ultimately assumes control after all initialization procedures have been accomplished, including display of the Main Window. `XtMainLoop()` implements an infinite event-monitoring loop which executes (dispatches messages to) registered event handling and/or callback functions in response to the occurrence of events.

4.1.2 MDMS Main Window

The Main Window CSU is illustrated in Figure 2. It is subdivided into five areas:

a. The title area;
b. The menubar which allows access to user-selectable menu items via pulldown menus;
c. The “Data Selection” area which provides access to most configuration parameters required to identify MOODS datasets and/or subsets;
d. The "Selection Status" area which displays range limits (minimum and maximum) for parameters defined within the "Data Selection" area and for the "Select: Region" and "Select: Time" menu items;
e. The "Remark" textbox which communicates important messages, such as errors, to the user.

The Main Window is created and displayed during application initialization. All MDMS features are initiated via the Main Window or its subordinate windows (pop-ups, textboxes, listboxes, etc.) which appear in response to user interaction with Main Window selection features.

4.1.2.1 MDMS Main Window Specification/Constraints

The design criteria for the MDMS Main Window CSU are listed in Section 7, "Requirements Traceability". This CSU is constrained by the following requirements:

a. The X-server must be opened and available for display;
b. UNIRAS ag/X Toolmaster must be active for handling graphics functionality;
c. The Empress RDBMS must be active and the MOODS database must be open and available for reading.

4.1.2.2 MDMS Main Window Design

The MDMS Main Window design employs the X, Motif, NEONS, and UNIRAS ag/X Toolmaster libraries. The design is implemented during initialization by the function CreateTree().

4.1.3 GUI Functionality

After the MDMS Main Window has been displayed, the user is free to interact with it using the mouse and keyboard. The GUI translates all mouse and keyboard events into calls to event handlers and/or callback functions. If the event requires retrieval/ingestion of data from/to the MOODS database, the GUI calls upon a function within the DMM. If the event requires MDBA intervention or a security check, the GUI calls upon a function within the DAM.

4.1.3.1 The Menubar

The menubar consists of five pull down menu headers (Select, MDBA, Products, Util), each of which offers two or more subordinate menu items, plus the Help button which provides access to the on-line help facility. When clicked, a menu header is programmed to display its subordinate menu items, which themselves may be selected by clicking. The reaction of the application to selection of a menu item depends upon the functionality of the particular menu item. Selections made via the menubar provide access to all options that are not directly associated with establishing the criteria for data retrieval.

4.1.3.1.1 Select: Region

When the "Region" menu item is clicked, the function regionButtonPress() is executed and the window illustrated in Figure 4 is displayed. This window offers three options for selecting the boundaries of a geographical region. The "Region List" contains a listing of user-selectable predefined regions. When a pre-defined region is selected from the "Region List", the region boundary is displayed within the map window as a dashed rectangle, and, the labeled textboxes
within the “Region Coordinates” widget are modified to hold the latitude and longitude coordinate limits of the region. When a region is selected by dragging the mouse cursor across an area of the map display, the “Region Coordinates” textboxes are modified to hold the latitude and longitude coordinates of the region. Finally, a region may be defined by selecting individual textboxes within the “Region Coordinates” widget and entering replacement values from the keyboard. If greater resolution is required, the “Zoom” button located below the map will produce a pop-up window containing an enlarged image of the region defined on the map. The “File” pulldown menu provides menu items to exit the display and to reset the coordinates to their original values. Selecting the “Exit” menu item destroys the window and sends the latitude and longitude boundary coordinates to the “Selection Status” board within the MDMS Main Window.

Figure 4. The MDMS Region Selection Window. This window appears in response to selecting the “Region” menu item via the “Select” pulldown menu.

4.1.3.1.2 Select: Time

When the “Time” menu item is clicked, the function timeButtonPress() is executed and the “Time Selection” window illustrated in Figure 5 is displayed. This window offers options for selecting the time constraints for a MOODS database query. If the “Start” button is activated, the adjacent row of text widgets is also activated for input of minimum date/time values. If the “End” button is activated, the adjacent text widgets are activated for entry of maximum date/time values. Date entries may also be changed using the up or down arrow switch buttons to the right of the vertically arrayed “YEAR”, “MONTH”, “DAY”, and “JULIAN” textboxes. These arrow switches are manipulated by clicking. Changes made using the arrow switches are applied to the activated “Start” or “End” row of textboxes. Clicking the “Exit” button closes the “Time Selection” window and transfers the values to the maximum and minimum Date/Time textboxes within the “Selection Status” board of the MDMS Main Window.
Figure 5. The MDMS Time Selection Window. This window appears in response to selecting the "Time" menu item via the "Select" pulldown menu.

4.1.3.1.3 Select: Exit

When the "Exit" menu item is clicked, the function `exitProgram()` is executed. Clicking the "Exit" menu-item closes the MDMS main display screen and returns the user to the system command line prompt.

4.1.3.1.4 MDBA: Import (MDBA Only)

During initialization, the function `createDbatools()` determines if the user is the MDBA. The source code...

```c
if (!isDba) { XtSetArg (wargs[n], XmNsensitive, False);
```

sets the "Import" menu item's sensitivity argument to "False", thereby disallowing data import by users other than the MDBA. When the MDBA selects the "Import" menu item from the "MDBA" pull-down menu, the function `createImportExportDialog()` is executed with the `importexport->type` variable set to IMPORT and the "Input File" pop-up window (Figure 6) is displayed. The "Input File" pop-up window contains a textbox for entry of the file name (including path, if needed) and "Ok" and "Exit" buttons. To be ingested, the file contents must be in the "MOODS Admin" format. Clicking the "Ok" button executes the function `importexportOkSelect()` which, in turn, calls the DMM function `readIngest_file()` to read the file and ingest the data into the database. Clicking the "Exit" button executes the function `importexportExitSelect()` which destroys the "Import File" pop-up window and returns to the `XtMainLoop()` function without performing any data ingestion operations.
4.1.3.1.5 MDBA: Export

The MOODS export facility is available to all users possessing a level of access appropriate for the data to be exported. When the user selects the “Export” menu item from the “MDBA” pull-down menu, two additional menu items appear, “Export Admin” and “Export IDEAS”. If “Export Admin” is selected, the function createImportExportDialog() is executed with the importexport->type variable set to EXPORT and the “Export File” pop-up window (Figure 7.a) is displayed. If “Export IDEAS” is selected, createImportExportDialog() is executed with the importexport->type variable set to EXPORT_IDEAS and the “Export IDEAS File” pop-up window (Figure 7.b) is displayed. Both export pop-up windows contain a textbox for entry of the export file name (including path, if needed), and “Ok” and “Exit” buttons. Clicking the “Ok” button executes the function importexportOkSelect() which, in turn, calls the DMM function exportData2File() which writes the data to the named file in either MOODS “Admin” or MOODS “IDEAS” format. The format depends upon the value of importexport->type (EXPORT or EXPORT_IDEAS). Clicking the “Exit” button executes the function importexportExitSelect() which destroys the file export pop-up window and returns to the XtMainLoop() function without performing any data export functions.

4.1.3.1.6 MDBA: Update Table (MDBA Only)

The “Update Table” menu item is a tool for use of the MDBA only. During initialization, the function createDbaTools() determines if the user is the MDBA. The source code...

```c
if (!isDba) { XtSetArg (wargs[n], XmNsensitive, False); }
```
sets the "Update Table" menu item's sensitivity argument to "False", thereby disallowing data table updates by users other than the MDBA. When selected, the "Update Table" menu item produces a submenu with three selectable menu items: "Update Instrument"; Update Source"; and "Update Classification". The GUI functions respectively responsible for these options are updateClassification(), updateInstrument(), and sourceUpdate(), producing the pop-up windows shown in Figures 8.a, 8.b, and 8.c. Each of these functions executes the DAM function changeTable() to "ADD", "DELETE", or "UPDATE" the contents of the specified qualitative code. changeTable(), in turn, calls the DMM function moodsUpdateQltvInfo() which updates the MOODS database qualitative information table and makes the appropriate entry in the MOODS Log.

Figure 8.a. MDBA Update Instrument Pop-up Window.

Figure 8.b. MDBA Update Source Pop-up Window.
4.1.3.1.7 PRODUCTS: Distribution

When the user clicks the "Distribution" menu item from the "Products" pulldown menu, the GUI function `selectDistribution()` is executed. `selectDistribution()` produces the MOODS "Distribution Plot" pop-up window shown in Figure 9, which allows user definition of data distribution plotting options ("Distribution", "Histogram" or "Accumulation"). This window also offers choices for latitude/longitude and coastline resolution, display to screen or printer, and (optionally) the inclusion of a title. Relevant GUI callback functions and their roles in generating MDMS Products:Distribution displays are as follows:

- `plotTypeTogglePress()` - upon selection (click) of the "Distribution" toggle button.
- `histTypeTogglePress()` - upon selection (click) of the "Histogram" toggle button.
- `acclTypeTogglePress()` - upon selection (click) of the "Accumulation" toggle button.
- `devTogglePress()` - upon user selection of display choice ("Screen" or "Printer").
- `choose3Km()`, `choose8Km()`, or `choose2OKM()` - upon selection of the type of coastline to be drawn in conjunction with the plot.
- `exitDistribution()` - upon selection (click) of the "Exit" pushbutton.
- `enterLatDeg()` - supports text entry of latitude (east/west) square size.
- `enterLonDeg()` - supports text entry of longitude (north/south) square size.
- `enterTitle()` - supports text entry of an optional plot title.
- `executePlotDistribution()` - upon selection (click) of the "Ok" button and calls the appropriate routine based on the plot type selected.
- `exposeDistribution()` - exposes the "Distribution" plot drawing area window and its contents.
- `destroyDialog()` - destroys the pop-up window upon exiting.
- `exposeHistogram()` - exposes the "Histogram" plot drawing area window and its contents.
- `exposeAccel()` - exposes the "Accumulation" plot drawing area and its contents.

These functions will, in turn, call a variety of associated functions within the DMM to obtain the appropriate data from the database. The data query is constructed from information contained in the "Selection Status" board (Section 4.1.3.3). Figures 10.a and 10.b are example distribution/accumulation and histogram plots.
Figure 9. Distribution Plot Definition Window.

Figure 10.a. Profile Distribution/Accumulation Plot Window.
4.1.3.1.8 PRODUCTS: Depth Vs. Parm

When the "Depth Vs Parm" menu item is clicked, the function `selectParmvsDepth()` is executed. `selectParmvsDepth()` produces an adjacent pulldown submenu for choosing Depth vs. Temperature, Depth vs. Salinity, or Depth vs. Sound Speed. Selection of either submenu item produces the appropriate depth vs. parm definition window for that option. Figure 11 illustrates the depth vs. temperature parm definition window (The depth vs. salinity and depth vs. sound speed definition windows are labeled "Salinity" and "Sound Speed", respectively; otherwise, they are identical in appearance and functionality to the depth vs. temperature window). Relevant GUI functions and their roles in generating MDMS Products:Depth vs. Parm displays are as follows:

- `sndSpdSelect()` - when Sound Speed parameter has been chosen as the composite plot.
- `tempSelect()` - when Temperature parameter has been chosen as the composite plot.
- `salinitySelect()` - when Salinity parameter has been chosen as the composite plot.
- `tempvsSalinitySelect()` - when Temp vs Salinity has been chosen as the composite plot.
- `countSizeEdit()` - supports text entry of maximum number of MOODS profiles.
- `minXEdit()` - supports text entry of minimum value for X-axis.
- `maxXEdit()` - supports text entry of maximum value for X-axis.
- `minYEdit()` - supports text entry of minimum value for Y-axis.
- `maxYEdit()` - supports text entry of maximum value for Y-axis.
titleEdit() - supports text entry of a graph title.
exitParmVaDepth() - when the “Exit” pushbutton has been selected.
compDevTogglePress() - when the device selection (printer/screen) toggle button has been clicked.
exposeComposite() - to expose the composite drawing area.

When the “Ok” button is pressed, the function executeCompositePlot() calls the DMM function commonMoodsRead() which retrieves appropriate data from the MOODS database. executeCompositePlot() then calls the GUI function drawComposite(), which draws and exposes the composite parameter vs. depth window and its contents. Figure 12 illustrates the “Temperature vs. Depth” composite plot. Other composite plots are similar.

Figure 11. Depth vs. Temperature Definition Window.

19
4.1.3.1.9 PRODUCTS: Print Header

The function selectPrintHeader() creates the dialog pop-up window, Figure 13, in response to selection of the “Print Header” menu item from the “Products” pulldown menu. selectPrintHeader() calls the function outputFormatDialog() to perform the actual creation of the dialog pop-up window. outputFormatDialog() registers callback functions fileTogglePress(), screenTogglePress() and printTogglePress() which process user selection of an output device. fileTogglePress() calls the function filenameDialog() to create a secondary pop-up dialog window for retrieval of a user-entered filename by the callback function readFilename(). Selection of the “Exit” button is processed by the callback function exitPrintHeader(). The callback function executePrintHeader() is registered (indirectly, via the outputFormatDialog() argument proc()) to process selection of the “OK” button. executePrintHeader() calls the DMM function commonMoodsRead() to retrieve the appropriate data from the database and the DMM function moodsLogMesgEntry() to make the required log entry. The screen, file or printer output from the “Print Header” menu item is in MOODS ADMIN format. Screen output is displayed by making a system call invoking the UNIX vi text editor.
4.1.3.1.10 PRODUCTS: Print Log (MDBA Only)

The "Print Log" menu item responds only to the MDBA. The "Print Log" dialog window, Figure 14, is produced by the callback function selectPrintLog() which calls the function printLogLayoutO to construct the necessary window components and register the necessary callback functions as follows:

readFunctionO - to capture the MDMS transaction function type(s) selected from the scrollable "Functions" list.
readUserNameO - to capture the name of the user of interest to the MDBA.
readMinDateO - to capture the minimum date as entered in the "Min Date" field.
readMaxDateO - to capture the maximum date as entered in the "Max Date" field.
to_fileTogglePressO - to process MDBA selection of the "File" output option.
executeLogDataO - to process MDBA selection of the "OK" button.
resetLogStructO - to process MDBA selection of the "Reset" button.
quitPrintLogO - to process MDBA selection of the "Exit" button.

fileTogglePressO calls the function filenameDialogO to create a secondary pop-up dialog window for retrieval of a user-entered filename by the callback function readFilenameO. executeLogDataO calls the DMM function moodsLogDataO to retrieve log entries that meet the criteria established by MDBA entries in the "Print Log" dialog window and output the data to screen, printer or file (see Figure 15).
4.1.3.1.11 PRODUCTS: Page Summary

The “Page Summary” pop-up dialog menu item, Figure 16, is created by the callback function `selectPageSummary()`. `selectPageSummary()` presents three page summary output options (screen, printer or file). Actual creation of the dialog window is accomplished by the function `outputFormatDialog()` which registers callback functions `fileTogglePress()`, `screenTogglePress()` and `printTogglePress()` to process user selection of an output device. `fileTogglePress()` calls the function `filenameDialog()` to create a secondary pop-up dialog window for retrieval of a user-entered filename by the callback function `readFilename()`. The function `executePageSummary()` is passed as an argument to `outputFormatDialog()` by `selectPageSummary()`. `executePageSummary()` processes retrieval of the appropriate data from the database via DMM function `commonHeaderRead()` and outputs the page summary to file, screen or printer. `outputFormatDialog()` reuses the callback function `exitPrintHeader()` to process selection of the “Exit” button. Figure 17 is an example of “Page Summary” screen output.
4.1.3.12 UTIL: Read Defaults File

The function `createUtil0` registers the callback function `selectReadFile0` to create the "Read Defaults File" pop-up dialog window shown in Figure 18. This dialog window is a standard Motif widget created by the function `XmCreateFileSelectionDialog()`. File/directory selection from the scrollable listings, entry of a path/file into the "Selection" textbox and selection of the "Directory" button are handled internally by the widget. The callback function `fileNameAcceptCB0` responds when the "Load" button is selected by calling the function `executeReadDefaultsFile0`. `executeReadDefaultsFile0` resets MDMS default values to those contained in the newly loaded defaults file via the functions `readMoodsDefaults0`, `clearMoodsStruct0`, `clearMoodsSelection0` and `setMoodsSelection0`. 
4.1.3.1.13 UTIL: Write Defaults File

The function `createUtil()` registers the callback function `selectWriteFile()` to create the "Write Defaults File" pop-up dialog window shown in Figure 19. `selectWriteFile()`, in turn, calls the function `createFileNameDialog()` which registers the additional callback functions `exitDefaultsFile()` and `executeWriteDefaultsFile()` to handle the "Exit" and "OK" buttons, and the callback function `readFileName()` to capture the output filename entered by the user. `executeWriteDefaultsFile()` collects current values for all default variable members and writes them to a text file.

4.1.3.1.14 HELP

The function `createMenuOptions()` registers the callback function `moodsOpnHelp()` to create pop-up dialog windows in response to selection of the "Help" menu header. `moodsOpnHelp()`, in turn, registers the callback function `moodsOpnHelpOk()` to process selection of the "OK" button associated with each "Help" pop-up dialog window. `moodsOpnHelp()` registers a recursive callback to itself to process a series of help pop-up dialog windows. Help text is contained in the include file `moodsOpnHelp.h`. 
4.1.3.2 The Data Selection Screen

The "Data Selection" portion of the "Main Window" occupies most of the left side of the MDMS Main Window display screen (see Figure 2). The function dataSelAndDisplay() is called by the function CreateTree() to create both the "Data Selection" and "Selection Status" windows. dataSelAndDisplay() relies upon the function dataSelectDesign() to construct the "Data Selection" window and its suite of interactive widgets. dataSelectDesign() registers the following callback functions to process user selection and entry of key MDMS database query parameters, all of which must be defined prior to any database query:

- **readCruiseId()** - to read the minimum or maximum cruise-ID entered into the "Cruise ID" textbox.
- **readMonth()** - to capture the minimum or maximum month selected from the scrollable "Months" listbox.
- **readNumParm()** - to process the minimum or maximum number of parameters selected via the sliding "Number or Parameters" scale widget.
- **readLoadDate()** - to read the minimum or maximum loading date entered into the "Load Date" textbox.
- **readSource()** - to capture the minimum or maximum data source code selected from the scrollable "Source" listbox.
- **readClass()** - to capture the minimum or maximum classification code selected from the scrollable "Classification" listbox.
- **readInst()** - to capture the minimum or maximum instrument code selected from the scrollable "Instrument" listbox.

*Note: dataSelectDesign() employs the function fillList() to construct the codes listed in the "Source", "Classification" and "Instrument" listboxes.

The statement...

```c
if (moods_struct->query_val->selection_type == MINIMUM)
```

determines if the value retrieved by the callback functions represents a minimum or maximum value for each parameter. moods_struct->query_val->selection_type is set by the callback functions minTogglePress() and maxTogglePress() which are registered by selectDisplayDesign(), the function which is ultimately responsible for creating the "Selection Status" window located to the right of the "Data Selection" window. Maximum and minimum values for the key parameters are placed in the structure moods_struct where they may be accessed by other MDMS functions.

4.1.3.3 The Selection Status Screen

The "Selection Status" portion of the "Main Window" occupies most of the right side of the MDMS Main Window display screen (see Figure 2). The function dataSelAndDisplay() is called by the function CreateTree() to create both the "Selection Status" and "Data Selection" windows. dataSelAndDisplay() relies upon the function selectDisplayDesign() to construct the "Selection Status" window and its suite of interactive widgets. selectDisplayDesign() registers the following callback functions to retrieve and display minimum and maximum values for the key parameters defined within the "Data Selection" window:
minTogglePress() - to set data selection mode to minimum in response to clicking the "Minimum" toggle button.
maxTogglePress() - to set data selection mode to maximum in response to clicking the "Maximum" toggle button.

readMinTime() - to retrieve the minimum time from the moods_struct structure.
readMaxTime() - to retrieve the maximum time from the moods_struct structure.
readMinLon() - to retrieve the minimum longitude from the moods_struct structure.
readMaxLon() - to retrieve the maximum longitude from the moods_struct structure.
readMinLat() - to retrieve the minimum latitude from the moods_struct structure.
readMaxLat() - to retrieve the maximum latitude from the moods_struct structure.

The non-callback function getMonthName() is invoked to retrieve the minimum or maximum month value from the moods_struct structure. The remaining maximum and minimum parameter values are directly retrieved from the moods_struct structure and inserted into their text widgets by the function selectDisplayDesign().

4.1.3.4 Remarks

The "Remarks" label button and its accompanying textbox are created and displayed by the function CreateTree(). Messages are printed in the "Remarks" textbox by the function printmesg() and removed by the function clearmesg().

4.2 CSC-2 - The MDMS Data Management Module (DMM)

Visible functionality of the MDMS is the responsibility of the GUI. The DMM responds to internal requests from the GUI, the DAM or other DMM functions. A request may require data retrieval from the MOODS database. It may require creation of a new process or application of an algorithm on the data after it is retrieved from the database. The DMM may be called upon to read MOODS data from an import file and ingest it into the MOODS database. Effectively, the user is insulated from the functionality of the DMM, seeing only the results which are displayed by the GUI. Any data processing chores performed by the DMM are associated with the need to 1) provide data in specified formats to the GUI and/or DAM, or 2) ingest/retrieve data to/from the supporting MOODS database. The CSU-level design of the DMM is embodied in those functions which interact with the GUI, DAM and the supporting database.

4.2.1 DMM Interaction with the GUI

With two exceptions (see Section 4.2.2, below), all communications with the DMM and its underlying database is invoked by the GUI. At the CSU level, DMM interaction with the GUI is accomplished via the following DMM functions:

InitMoodsStruct() - to allocate memory for the structure moods_struct and initialize values. Default data values are obtained from the moods_defaults file by the function readMoodsDefaults() and passed to GUI functions such as selectDisplayDesign() which display the values within its "Selection Status" text widgets. InitMoodsStruct() is also invoked by

exportData2File() - called by the GUI function importexportOkSelect() to query retrieve data from database and write it to a file.

readIngest_file() - called by the GUI function importexportOkSelect() to import MOODS ADMIN data into database with latitude, longitude and time plus seven additional variables.
executeCompositePlot() - called by selectParmvsDepth() to fetch data from the database for use in drawing composite parameter vs. depth plot.

executePrintHeader() - called by outputFormatDialog() to fetch data from the database for use by the Print Header menu option.

executeLogData() - called by printLogLayout() to retrieve specific log entries from the database as defined by the MDBA.

executePageSummary() - called by outputFormatDialog() to retrieve header information from the database for use by the Page Summary menu option.

getObsData() - called by distributionDraw(), exposeDistribution(), exposeHistogram() and exposeAccel() to read observation data from database for distribution, histogram and accumulation plots.

litMapFuncs() - called by distributionDraw() and exposeDistribution() to read geographic coastline data from database for plotting on a registered grid.

4.2.2 DMM Interaction with the DAM

As indicated in Figure 3, the DMM and DAM are not routinely required to communicate directly in order to support MDBA-specific actions relative to database maintenance. In most cases, the communication is accomplished indirectly; i.e., the GUI serves as the messenger between the DAM and the DMM. The following DMM functions are exceptions in that they do communicate directly with the DAM:

moodsUpdateQltvInfo() - called by the DAM function changeTable() to update the MOODS database qualitative information table and make the appropriate entries in the MOODS Log table.

moods_brws_20 - called by the DAM function chk_clas_acc() to compare access privileges of user with selected classification code range.

4.2.3 DMM Interaction with the MOODS Database

DMM functions that interact with the MOODS database and their purpose are as follows:

commonHeaderRead() - to read header information from the database.

lit7_rd() - to read lit records from the database.

lit7_opn() - to open the MOODS database.

moodsUpdateQltvInfo() - to update the MOODS database qualitative information table and makes the appropriate entry in the MOODS Log.

lit7_wr() - to write a primary MOODS profile data record to the database.

lit7_wr_as() - to write an associative record to the MOODS database for an ingested dataset.

4.3 CSC-3 - The MDMS Data Administration Module (DAM)

The purpose of the DAM is to support 1) MOODS Database Administrator (MDBA) control of the MDMS and 2) to exclude user access to unauthorized data. User access criteria can only be established by the MDBA, which emphasizes the critical security responsibilities of the MDBA. The DAM interacts directly with the GUI in support of database and software maintenance requirements. Aside from the two exception noted in Section 4.2.2, there is no direct link between the DAM and the DMM. Instead, interaction between the DAM and the DMM is accomplished via the GUI.
4.3.1 DAM Interaction with the GUI

At the CSU level, the following DAM functions interact with the GUI to perform the tasks indicated:

- `getUlogin()` - called by `main()` to obtain user identification of the current process.
- `getDba()` - called by `main()` to identify the database creator.
- `checkAccess()` - called by `importExportOkSelect()` and `exportData2File()` to ensure verify user access permissions for file read/write operations.
- `changeTable()` - called by `insCodeType()`, `updateCodeType()` and `delCodeType()` to make necessary changes to MDBA-controlled parameter values (classification, instrument and source).

4.3.2 DAM Interaction with the DMM

(see Section 4.2.2)

5 MDMS DATA

5.1 The MOODS Database

The MOODS database is described in Appendix C.

5.2 MDMS User Configuration Data

User configuration data is contained in the `moods.defaults` file. An example `moods.defaults` file can be found in Appendix G.

6 MDMS DATA FILES

The MDMS retrieves data from the MOODS database, data import files and the user configuration file. There are no other data requirements for the MDMS.

7 REQUIREMENTS TRACEABILITY

MDMS functional requirements (MFR) and design requirements (MDR) have been defined for the MDMS. MFR/MDR requirements are also indicated in paragraphs 3.2.1, 3.2.2 and 3.2.3 for cross-reference and traceability. CSC responsibility for achieving each MFR and MDR are indicated parenthetically in the following descriptions for each MFR and MDR.

MDMS FUNCTIONAL REQUIREMENTS (MFR)

MFR1: Operate in an interactive manner, i.e., displays must be interactive. (GUI)
MFR2: Interactively identify geographical region boundaries. (GUI)
MFR3: Interactively identify time and date ranges. (GUI)
MFR4: Interactively identify specific classification codes and ranges of same. (GUI)
MFR5: Interactively identify specific cruise identification numbers and ranges of same. (GUI)
MFR6: Interactively identify specific data source codes and ranges of same. (GUI)
MFR7: Interactively select specific month constraints and ranges of same. (GUI)
MFR8: Interactively enter specific data loading dates and ranges of same. (GUI)
MFR9: Interactively toggle between selection of minimum and maximum retrieval parameter criteria. (GUI)
MFR10: Interactively select combinations of temperature, salinity and/or sound speed for processing. (GUI)
MFR11: Provide on-line help to users. (GUI)
MFR12: Provide on-line addition, deletion and update capability to the MDBA for classification codes, cruise identification numbers and data source codes. (GUI/DAM)
MFR13: On-line data import capability for MDBA. (GUI/DMM/DAM)
MFR14: On-line data export capability for users. (GUI/DMM)
MFR15: Error feedback via message facility. (GUI/DMM/DAM)
MFR16: Capability for multiple configuration/initialization files. (CSCI)
MFR17: Interactively indicate completion of retrieval criteria development and commencement of data retrieval operation based on the indicated criteria. (GUI/DMM)
MFR18: Overlay data distribution plots as points on a geographic map window. (GUI/DMM)
MFR19: Produce histogram display of data density. (GUI/DMM)
MFR20: Display depth versus parameter (temperature, salinity, sound speed) plots. (GUI/DMM)
MFR21: Display temperature versus salinity plots. (GUI/DMM)
MFR22: Output header information to printer, screen or file. (GUI/DMM)
MFR23: Maintain log of user activity with ability to print same to printer, screen or file. (GUI/DMM)
MFR24: Output statistical summary of data retrieved from database with ability to print same to printer, screen or file. (GUI/DMM)
MFR25: Provide MOODS data editing capability. (independent of MDMS)
MFR26: System must be able to graphically plot temperature and salinity profiles onto a geographic grid or X-Y plot. (GUI)
MFR27: Access to MOODS ASCII format. (DMM)
MFR28: Access to MOODS ADMIN format. (DMM)
MFR29: Access to Coastlines/Shorelines. (DMM)
MFR30: Selectively evaluate and/or edit MOODS data. (GUI/DMM)
MFR31: Selectively retain subsets of environmental data after evaluation and/or editing procedures have been performed. (DMM)
MFR32: Interactive termination of application. (GUI)
MFR33: Interactive reset of data retrieval parameters. (GUI)

**MDMS DESIGN REQUIREMENTS (MDR)**

MDR1: The MDMS must operate as a stand-alone system. (CSCI)
MDR2: The MDMS must operate within the UNIX operating system environment. (CSCI)
MDR3: The MDMS must execute within the X-Windows client-server model. (CSCI)
MDR4: Window displays must incorporate the Open Software Foundation (OSF) Motif Widget Library. (CSCI)
MDR5: An independent relational database management system (rdbms) specifically for MOODS utilization. (DMM)
MDR6: The Naval Environmental Operational Nowcast System (NEONS) will be incorporated as the interface to the rdbms. (DMM)
MDR7: The MDMS must contain internal links to the MOODS rdbms for data import/export/retrieval. (DMM)
MDR8: The MDMS must incorporate detection of user privilege levels based on data classification codes. (GUI)
8 NOTES

A glossary of terms is contained in Appendix A. A listing of acronyms is contained in Appendix B. Appendix C is the MDMS RDBMS Specification. Appendix D lists MOODS RDBMS functional (DBFR) and design (DBDR) requirements. Appendix E discusses the MDMS development environment. Appendix F is a listing of MOODS structures. Appendix G provides an explanation of the user default file.
APPENDIX A. GLOSSARY OF TERMS

Computer Software Configuration Item (CSCI) - a software application or a major component thereof.

Computer Software Component (CSC) - a top level functional module within a computer software configuration item (CSCI). CSC’s are generally considered to be one structural level below the CSCI.

Computer Software Unit (CSU) - low level software modules, usually at the function or subroutine level that perform specific functions within a CSC.

Data Administration Module (DAM) - the MDMS module responsible for MDBA security and administrative maintenance functions.

Data Management Module (DMM) - the MDMS module responsible for database access.

Graphical User Interface (GUI) - the MDMS module responsible for interfacing with the user and controlling the graphical and display functionality of the MDMS.

Widget - "... a graphic device capable of receiving input from the keyboard and the mouse and communicating with an application or another widget by means of a callback. Every widget is a member of only one class and always has a window associated with it." (from: OSF/Motif Programmer's Guide, Rev. 1.1, Open Software Foundation, Prentice Hall, Englewood Cliffs, NJ, 1991, p. GL-13.)
APPENDIX B. LIST OF ACRONYMS

ANSI - American National Standards Institute  
CAST - Center for Air Sea Technology  
CSC - Computer Software Component  
CSCI - Computer Software Configuration Item  
CSU - Computer Software Unit  
DAM - Data Administration Module  
DBDR - Database Design Requirement  
DBFR - Database Functional Requirement  
DMM - Data Management Module  
DOD - Department of Defense  
GUI - Graphical User Interface  
IDEAS - Interactive Data Editing and Analysis System  
MDBA - MOODS Database Administrator  
MDMS - MOODS Data Management System  
MDR - MDMS Design Requirement  
MFR - MDMS Functional Requirement  
MOODS - Master Oceanographic Observation Data Set  
MSU - Mississippi State University  
NASA - National Aeronautics and Space Administration  
NAVOCEANO - Naval Oceanographic Office  
NEONS - Navy Environmental Operational Nowcast System  
OSF - Open Software Foundation  
RDBMS - Relational Database Management System  
SQL - Structured Query Language
APPENDIX C. THE MOODS RELATIONAL DATABASE MANAGEMENT SYSTEM (RDBMS) SPECIFICATION

The MDMS accesses the MOODS RDBMS, a modified NEONS database created specifically to support the CSCI. The MOODS database exists as a dedicated external and independent element of the system, accessible via embedded SQL queries to the underlying RDBMS engine. The MDMS queries the database and retrieves requested data from it by calling NEONS software library functions. NEONS provides a data model for all generic data types (grid, volume, latitude/longitude/time (LLT), line, image and geographical); however, the MDMS only uses a modified version of the latitude/longitude/time data type to store MOODS profiles, plus the geographical data type which stores coastlines and ocean bathymetry datasets. MOODS profile datasets can be retrieved by the following parameters:

- latitude
- longitude
- date/time
- month
- water depth
- parameter
- source code
- instrument
- classification code
- cruise identification number.

These parameters represent an enhancement of NEONS capability to meet MDMS requirements. The NEONS latitude/longitude/time data type allows queries only by latitude, longitude and date/time. The additional parameters (month, water depth, parameter, source code, instrument, classification code, and cruise identification number) were moved from the RDBMS binary large object storage format to allow faster dataset specification and retrieval. The MDMS-specific version of the LLT data type is referred to as “LLTN_7” because of the seven additional query parameters. The MDMS version of NEONS also incorporates special relational tables to support security classification codes and a MOODS transaction log.

Further information about NEONS, its structure and use is available in the NEONS design document ["Database Design Document for the Naval Environmental Operational Nowcast System", Version 3.5, Naval Research Laboratory (NRL), Monterey, CA 93943-5006]. In addition, the NEONS insallation package includes source code and manual pages for each major functional element. NEONS version control is managed by the Naval Research Laboratory, Monterey, CA.
APPENDIX D. FUNCTIONAL AND DESIGN REQUIREMENTS FOR THE MOODS RELATIONAL DATABASE MANAGEMENT SYSTEM (RDBMS)

DATABASE FUNCTIONAL REQUIREMENTS (DBFR):

DBFR1: Database must be capable of data retrieval.
DBFR2: Data ingestion into the rdbms is to be accomplished either internally or externally to the MDMS.
DBFR3: The searchable database attributes must include month, water depth, parameter, source code, instrument type, classification and cruise identification number.

DATABASE DESIGN REQUIREMENTS (DBDR):

DBDR1: RDBMS engine is Empress.
DBDR2: RDBMS model is the Naval Environmental Operational Nowcast System (NEONS) Version 3.5.1.
DBDR3: Database must be compatible with NAVOCEANO Program Modernization Initiative (PMI).
APPENDIX E. THE MDMS DEVELOPMENT ENVIRONMENT

The MDMS has been developed in a Sun Microsystems SparcStation model 10 computer hardware environment. The operating system was SUNOS version 4.1.3, including the resident SUN C compiler which was used to write the MDMS software code. Some minor elements of NEONS have been written in FORTRAN77 (Sun FORTRAN77 version 1.4). Graphics support is provided by UNIRAS ag/X Toolmaster version 6v3b. The RDBMS engine is Empress version 6.2. The windowing environment consists of X-Windows version X11 R5 and the OSF Motif widget set version 1.3.
APPENDIX F. MOODS STRUCTURES

A C structure is a collection of data variables, pointers or other structures grouped together for the convenience of using a single variable name to reference or identify the whole group. The use and behavior of structures is covered in any credible C programming language tutorial or textbook.

1. The NAVO Structure - comprises the critical data framework of the MDMS application. The NAVO structure and its internal structures are defined as follows:

```c
typedef struct
{
    STATUS_BOARD_WIDGETS *status_board_widgets;
    QUERY_VAL *query_val;
    TIME_LOC *LocTime;
    Widget region, globe_map;
    char seq_type[31];
    char vrsn_name[31];
    char defaultsFile[120];
} NAVO;

typedef struct
{
    Widget lat_min_text, lat_max_text;
    Widget lon_min_text, lon_max_text;
    Widget time_min_text, time_max_text;
    Widget class_min_text, class_max_text;
    Widget month_min_text, month_max_text;
    Widget parm_min_text, parm_max_text;
    Widget cruise_min_text, cruise_max_text;
    Widget inst_min_text, inst_max_text;
    Widget source_min_text, source_max_text;
    Widget load_min_text, load_max_text;
    Widget min_toggle, max_toggle;
} STATUS_BOARD_WIDGETS;

typedef struct
{
    double lat_min_val, lat_max_val;
    double lon_min_val, lon_max_val;
    DATE time_min_val, time_max_val;
    int hour_min_val, hour_max_val;
    int mnt_min_val, mnt_max_val;
    int sec_min_val, sec_max_val;
    long class_min_val, class_max_val;
    long month_min_val, month_max_val;
    long parm_min_val, parm_max_val;
    long cruise_min_val, cruise_max_val;
    long inst_min_val, inst_max_val;
    long source_min_val, source_max_val;
    long load_min_val, load_max_val;
    Boolean selection_type;
} QUERY_VAL;
```
typedef struct {
    DATE start_date;
    DATE end_date;
    double min_lon;
    double max_lon;
    int start_hour;
    int end_hour;
    int start_min;
    int end_min;
    int start_sec;
    int end_sec;
} TIME_LOC;

Note: The Widget structure is proprietary to the XLib/MOTIF libraries.

2. The NAVO_DATE Structure - defines the elements which comprise date and time within the MDMS.

typedef struct {
    int hour;
    int min;
    int day;
    int month;
    int year;
} NAVO_DATE;

3. The DISTRIBUTION Structure - groups all variables required to plot a histogram or accumulation chart.

type def struct {
    float lat_deg;     /* latitude interval */
    float lon_deg;     /* longitude interval */
    int lon_binsize;   /* longitude cell count */
    int lat_binsize;   /* latitude cell count */
    Boolean grid;      /* To indicate if grid is needed */
    char coast_type[15]; /* 3km, 8km, 20km */
    char title1[50];   /* Plot type title */
    char title2[50];   /* User-supplied title */
    int dev_type;      /* Screen/window */
    int plot_type;     /* Plot/Histogram/Accumulation */
    int rec_num;       /* Num of Obs Read */
    Boolean thereisaacclpix;/* Indicates presence of Pixmap */
    Boolean thereisahistpix;/* Indicates presence of Pixmap */
    Boolean thereisapix;  /* Indicates presence of Pixmap */
    Pixmap pixmap;     /* Pixmap to store graphics */
    XWindowAttributes pix_at;  /* Store dimensions of Pixmap */
    XWindowAttributes hist_pix_at; /* Store dimensions of Pixmap */
    XWindowAttributes accl_pix_at; /* Store dimensions of Pixmap */
}
4. The PARMVSDEPTH Structure - groups all variables required to plot a parameter vs. depth chart.

    typedef struct {
      float min_x;    /* Min x-axis value */
      float max_x;    /* Max x-axis value */
      float min_y;    /* Min y-axis value */
      float max_y;    /* Max y-axis value */
      char title[50]; /* graph title */
      float **depth; /* depth Values */
      float **data_array; /* Data Values */
      int *prof_points; /* Points Per Profile */
      int prev_max_count; /* Maximum profiles */
      int max_count;    /* Maximum profiles */
      int parm_type;    /* Parameter type */
      int total_obs;    /* Total Recs */
      NAVO *moods_struct; /* Global Structure */
      Boolean thereisacomppix; /* Boolean Flag */
      Boolean dataset_selected; /* Boolean Flag */
      Pixmap comp_pixmap; /* Pixmap */
      Window window;     /* Window ID */
      int dev_type;      /* Screen/window */
    } PARMVSDEPTH;

5. The LOGSTRUCT Structure - groups the necessary variables to output a portion of the MDMS transaction log.

    typedef struct {
      int log_type;
      Widget list;
      Widget to_screen;
      Widget to_file;
      Widget to_printer;
      Widget name_text;
      Widget min_date_text;
      Widget max_date_text;
      Widget msg_text;
      char userName[20];
      DATE min_date;
    } LOGSTRUCT;
DATE  max_date;
long  func_id;
long  min_func_id;
long  max_func_id;
char  filename[80];
} LOGSTRUCT;

6. The SMRYPAGE Structure - groups the necessary variables to output a summary page.

typedef struct {
    float min_lat;
    float min_lon;
    float max_lat;
    float max_lon;
    struct {
        int yr;
        int ttl_yr_cnt;
        struct {
            int mo;
            long ttl_mo_cnt;
        } mo_bin[12];
    } yr_bin[MAX_CNT];
    struct {
        long src_code;
        long ttl_src_cnt;
    } src_bin[MAX_CNT];
    struct {
        long inst_code;
        long ttl_inst_cnt;
    } inst_bin[MAX_CNT];
    struct {
        int clas_code;
        long ttl_clas_cnt;
        long ttl_qual_cnt;
        long ttl_dist_cnt;
        long ttl_dist_qual_cnt;
    } clas_bin[MAX_CLAS_CNT];
} SMRY_PAGE;

7. The IMPORTEXPORT Structure - contains the necessary variables to import or export a data file.

typedef struct {
    NAVO  *moods_struct; /* Global Structure */
    char  filename[80]; /* Filename to store header */
    int   type; /* IMPORT,EXPORT, or EXPORT_IDEAS */
    Widget ok; /* Ok Widget */
} IMPORTEXPORT;
APPENDIX G. THE MDMS DEFAULT CONFIGURATION FILE

Default values for parameters appearing within the “Selection Status” textboxes of the MDMS main display may be maintained in a user-created default file. The user may specify the file containing default values by including the “-f” flag, followed by the filename, when launching the MDMS (example: moods -f myfile). If the default file is not indicated on the command line, the MDMS will look for the file moods.defaults in the current directory. If the moods.defaults file cannot be located, parameter boxes within the “Selection Status” portion of the main display will be blank at startup. The format for a default file is as follows:

<table>
<thead>
<tr>
<th>Label</th>
<th>Minimum</th>
<th>Maximum</th>
</tr>
</thead>
<tbody>
<tr>
<td>Latitude</td>
<td>21.3</td>
<td>30.0</td>
</tr>
<tr>
<td>Longitude</td>
<td>-121.0</td>
<td>-109.0</td>
</tr>
<tr>
<td>Date/Hour</td>
<td>19621207:6:0:0</td>
<td>19931008:12:0:0</td>
</tr>
<tr>
<td>Classification</td>
<td>1100010</td>
<td>1100010</td>
</tr>
<tr>
<td>Month</td>
<td>3</td>
<td>3</td>
</tr>
<tr>
<td>Parms</td>
<td>2</td>
<td>3</td>
</tr>
<tr>
<td>Cruise-Id</td>
<td>300</td>
<td>300</td>
</tr>
<tr>
<td>Instrument</td>
<td>25</td>
<td>25</td>
</tr>
<tr>
<td>source</td>
<td>4</td>
<td>4</td>
</tr>
<tr>
<td>load-date</td>
<td>19920616</td>
<td>19920616</td>
</tr>
</tbody>
</table>

The values contained in a default file are ordered in a top-to-bottom sequence according to their appearance within the “Selection Status” portion of the main display. The format is free form except that labels and numerical values must be separated by at least one space and each labeled line must end in a carriage return. For each labeled category, there are two numerical entries, a minimum and maximum value, on each line. The first numerical entry is the minimum value. The second numerical value is the maximum value.
DISTRIBUTION LIST

1. Commanding Officer, Code N3211
   Naval Oceanographic Office
   Stennis Space Center, MS 39529
   (10 copies)

2. Technical Director
   Code QOT
   COMNAVMETOCCOM
   Stennis Space Center, MS 39529

3. Oceanographer of the Navy
   U.S. Naval Observatory
   34th and Massachusetts Avenue
   Washington, DC 20392

4. Space and Naval Warfare
   Systems Command
   Code PMW175-3B
   2451 Crystal Drive
   Arlington, VA 22245-5200

5. Defense Technical Information Center
   Building 5, Cameron Station
   Alexandria, VA 22304-6145
   (2 copies)

6. Director, Sponsored Programs Administration
   Mississippi State University
   P.O. Box 6156
   Mississippi State, MS 39762
The MOODS Data Management System (MDMS) provides access to the Master Oceanographic Observation Data Set (MOODS) maintained by NAVOCEANO. This manual provides the design document and database specification for the MDMS.
