FY 1994 Scientific and Technical Reports, Articles, Papers, and Presentations

Compiled by
Joyce E. Turner
Marshall Space Flight Center • MSFC, Alabama
FOREWORD

In accordance with the NASA Space Act of 1958, the MSFC has provided for the widest practicable and appropriate dissemination of information concerning its activities and the results thereof.

Since July 1, 1960, when the George C. Marshall Space Flight Center was organized, the reporting of scientific and engineering information has been considered a prime responsibility of the Center. Our credo has been that “research and development work is valuable, but only if its results can be communicated and made understandable to others.”

The N number shown for the reports listed is assigned by the Center for AeroSpace Information (CASI), Baltimore, Maryland, indicating that the material is unclassified and unlimited and is available for public use. These publications can be purchased from the National Technical Information Service, 5285 Port Royal Road, Springfield, Virginia 22161. The N number should be cited when ordering.

The Space Sciences Laboratory (SSL) at Marshall Space Flight Center is a multiprogram facility. Scientific research is conducted in four discipline areas: Earth science and applications, solar-terrestrial physics, astrophysics, and microgravity science and applications. Representatives from each of these discipline areas participate in a Laboratory computer requirements committee, which has developed this document. The purpose of this document is to establish and discuss Laboratory objectives for computing and networking in support of science. The purpose is also to lay the foundation for a collective, multiprogram approach to providing these services. Special recognition is given to the importance of the national and international efforts of our research communities toward the development of interoperable, network-based computer applications.

Based on a new theory, two computer codes have been developed specifically to calculate the exact statistical tolerance limits for normal distributions within unknown means and variances for the one-sided and two-sided cases for the tolerance factor, $k$. The quantity $k$ is defined equivalently in terms of the noncentral $t$-distribution by the probability equation. Two of the four mathematical methods employ the theory developed for the numerical simulation. Several algorithms for numerically integrating and iteratively root-solving the working equations are written to augment the program simulation. The program codes generate some tables of $k$'s associated with the varying values of the proportion and sample size for each given probability to show accuracy obtained from small sample sizes.

A study of the corrosion protection of substrate metals by ion vapor deposited aluminum (IVD Al) coats has been carried out. Corrosion protection by both anodized and unanodized IVD Al coats has been investigated. Base metals included in the study were 2219-T87 Al, 7075-T6 Al, Titanium-6 Al-4 Vanadium (Ti-6Al-4V), 4130 steel, D6AC steel, and 4340 steel. Results reveal that the anodized IVD Al coats provide excellent corrosion protection, but good protection is also achieved by IVD Al coats that have not been anodized.

The subject of finite-element modeling has long been of critical importance to the practicing designer/analyst who is often faced with obtaining an accurate and cost-effective structural analysis of a particular design. Typically, these two goals are in conflict. The purpose of this study is to discuss the topic of finite-element modeling for solid/shell connections (joints) which are significant for the practicing modeler. Several approaches are currently in use, but frequently various assumptions restrict their use. In this study, such techniques currently used in practical applications have been tested, especially to see which technique is the most ideally suited for the computer-aided design (CAD) environment. Some basic thoughts regarding each technique are also discussed. As a consequence, some suggestions based on the results from this study are given to lead reliable results in geometrically complex joints where the deformation and stress behavior are complicated.
A Simplistic Look at Limit Stresses From Random Loading. H.M. Lee. Structures and Dynamics Laboratory. 94N-15710

Utilizing a continuous beam model, this report compares the potential stresses imposed on the beam from a random environment with those resulting from a typical static load analysis or test simulation. The Miles’ equation used to develop peak response accelerations is shown to become a force equation in the hands of strength assessment personnel. This may prove to be unrealistic since hardware dynamic stresses are related to deflection rather than load. Correlation of the stress state for any static analysis or test with the actual dynamic response stress is strictly dependent upon how well the static deflections simulate the predominant dynamic mode shape. The report proposes that the general shape of this predominant mode, along with the peak response accelerations of major masses be used in strength assessments. From these data, a tailored enforced displacement loading may prove to be more effective in reproducing random induced stresses on flight hardware.

On the Design of Structural Components Using Materials With Time-Dependent Properties. P.I. Rodriguez. Structures and Dynamics Laboratory. 94N-16519

The application of the elastic-viscoelastic correspondence principle is presented as a design tool for structural design engineers for composite materials applications. The classical problem of cantilever beams is used as the illustration problem. Both closed-form and approximate numerical solutions are presented for several different problems. The application of the collocation method is presented as a viable and simple design tool to determine the time-dependent behavior and response of viscoelastic composite beams under load.

Study of the National Science Foundation’s South Pole Station as an Analogous Data Base for the Logistical Support of a Moon Laboratory (CDDF Final Report No. 307-52-00-N09). H.H. Hickam, Jr. Mission Operations Laboratory. 94N-17469

The day will come when the United States will want to return to the Earth’s Moon. When that occurs, NASA may look to the Apollo program for technical and inspirational guidance. The Apollo program, however, was designed to be an end to itself—the landing of a man on the Moon and his return safely within the decade of the 1960’s. When that was accomplished, the program folded because it was not self-sustaining. The next time we return to the Moon, we should base our planning on a program that is designed to be a sustained effort for an indefinite period. It is the thrust of this report that the South Pole Station of the National Science Foundation can be used to develop analogs for the construction, funding, and logistical support of a lunar base. Other analogs include transportation and national efforts versus international cooperation. A recommended lunar base using the South Pole Station as inspiration is provided, as well as details concerning economical construction of the base over a 22-year period.
precipitation. Grain boundary precipitation and precipitate free zones (PFZ's) were observed in the wrought alloy after exposing to temperatures above 605 °C (1,120 °F). The fine-grained microstructure observed in the laser and electron-beam glazed NARloy-Z was much more stable at elevated temperatures. Microstructural changes correlated well with hardness measurements.

TM-108432 November 1993
A Simulation Model for Probabilistic Analysis of Space Shuttle Abort Modes. R.T. Hage. Preliminary Design Office. 94N-21859

This report presents a simulation model which has been developed to provide a probabilistic analysis tool to study the various space transportation system abort mode situations. The simulation model is based on Monte Carlo simulation of an event-tree diagram which accounts for events during the space transportation system's ascent and its abort modes. The simulation model considers just the propulsion elements of the shuttle system (i.e., external tank, main engines, and solid boosters). The model was developed to provide a better understanding of the probability of occurrence and successful completion of abort modes during the vehicle's ascent. The results of the simulation runs discussed in this report are for demonstration purposes only, they are not official NASA probability estimates.

TM-108433 December 1993
Performance Assessment of Low Pressure Nuclear Thermal Propulsion. H.P. Gerrish, Jr., and G.E. Doughty. Propulsion Laboratory. 94N-21860

A low pressure nuclear thermal propulsion (LPNTP) system, which takes advantage of hydrogen dissociation/recombination, has been proposed as a means of increasing engine specific impulse (Isp). This paper examines the effect of hydrogen dissociation/recombination on LPNTP Isp. A two-dimensional computer model was used to show that the optimum chamber pressure is approximately 100 psia (at a chamber temperature of 3,000 K), with an Isp ~ 15 s higher than at 1,000 psia. At high chamber temperatures and low chamber pressures, the increase in Isp is due to both lower average molecular weights caused by dissociation and added kinetic energy from monatomic hydrogen recombination. Monatomic hydrogen recombination increases the Isp more than hydrogen dissociation. Variations in the molecule fraction of monatomic hydrogen are similar to variations in static pressure along the axial nozzle position. Most recombination occurs close to the nozzle throat. Practical variations in nozzle geometry have minimal impact on recombination. Other models, which can simulate a wider range of nozzle designs, should be used in the future. The uncertainty of the hydrogen kinetic reaction rates at high temperatures (~3,000 K) affects the accuracy of the analysis and should be verified with simple bench tests.

TM-108434 December 1993
Detailed Study of Oxidation/Wear Mechanism in Lox Turbopump Bearings. T.J. Chase and J.P. McCarty. Propulsion Laboratory. 94N-21580

Wear of 440C angular contact ball bearings of the phase II high pressure oxygen turbopump (HPOTP) of the space shuttle main engine (SSME) has been studied by means of various advanced non-destructive techniques (NDT) and modeled with reference to all known material, design, and operation variables. Three modes dominating the wear scenario were found to be the adhesive/sheer peeling (ASP), oxidation, and abrasion. Bearing wear was modeled in terms of the three modes. Lacking a comprehensive theory of rolling contact wear to date, each mode is modeled after well-established theories of sliding wear, while sliding velocity and distance are related to microsliding in ball-to-ring contacts. Microsliding, stress, temperature, and other contact variables are evaluated with analytical software packages of SHABERTH™/SINDA™ and ADORE™. Empirical constants for the models are derived from NIST experiments by applying the models to the NIST wear data. The bearing wear model so established precisely predicts quite well the average ball wear rate for the HPOTP bearings. The wear rate has been statistically determined for the entire population of flight and development bearings based on Rocketdyne records to date. Numerous illustrations are given.

TM-108435 January 1994
MAMS Data for the Convection and Moisture Experiment (CAMEX). A.R. Guillory, G.J. Jedlovec, and R.J. Atkinson. Space Sciences Laboratory. 94N-24080

During the fall of 1993, NASA sponsored a field program called the Convection And Moisture Experiment (CAMEX). The field effort focused on: (1) convective storms in order to investigate their associated electrical properties, precipitation, and
predictability; and (2) atmospheric moisture studies. This document describes the data collected from the Multispectral Atmospheric Mapping Sensor (MAMS) onboard a NASA ER-2 aircraft which was deployed out of NASA/Wallops Flight Facility, Wallops Island, Virginia, from September 11 through October 7, 1993.

4 emissions were excited with a laser beam. When the D levels of E, and D levels of E, were resonantly excited with a laser beam of 640 nm, upconverted emissions were also observed from F and E levels of E, when the material was excited with an 800 nm near infrared laser. The numbers in parentheses are the wavelengths of the emissions.

94N-26150 A Survey of Visualization and Analysis Tools. P.J. Meyer. Space Sciences Laboratory. This large number of commercially available visualization and analysis tools are available to the researcher. This document discusses some of the strengths and limitations of some of these tools, from the viewpoint of the Earth sciences discipline. Visualization and analysis tools fall into one of two categories: those that are designed to a specific purpose and are nonextensible, and those that are generic visualization tools that are extensible. Most of the extensible packages examined incorporate a data flow paradigm.

577 nm, upconverted emissions were detected when this system was irradiated with a near infrared laser. Very weak upconverted emissions were detected when this system was irradiated with a near infrared laser. The numbers in parentheses are the wavelengths of the emissions.

The purpose of this document is to introduce Geographical Information System (GIS) terminology and summarize interviews conducted with scientists in the Earth Science and Applications Division (ESAD). There is a growing need in ESAD for GIS technology. With many different data sources available to the scientists comes the need to be able to process and view these data in an efficient manner. Since most of these data are stored in vastly different formats, specialized software and hardware are needed. Several ESAD scientists have been using a GIS, specifically the Man-computer Interactive Data Access System (McIDAS). McIDAS can solve many of the research problems that arise, but there are areas of research that need more powerful tools; one such example is the multispectral image analysis which is described in this document. Given the strong need for GIS in ESAD, we recommend that a requirements analysis and implementation plan be developed using this document as a basis for further investigation.

This report presents a summary of the spectroscopic study of three systems: LaF₃:Ho³⁺, LaF₃:Er³⁺, and CaF₂:Nd³⁺. When the D levels of Ho³⁺ in LaF₃ were resonantly excited with a laser beam of 640 nm, upconverted emissions were detected from J (416 nm), F (485 nm), and E (546 nm) levels. Energy upconverted emissions were also observed from F and E levels of Ho³⁺ when the material was excited with an 800 nm near infrared laser. When the D levels of Er³⁺ in LaF₃ were resonantly excited with a laser beam of 637 nm, upconverted emissions were detected from the E (540 nm) and P (320, 400, and 468 nm) levels. Energy upconverted emissions were also observed from F, E, and D levels of Er³⁺ when the material was resonantly excited with an 804 nm near infrared laser. When the D levels of Nd³⁺ in CaF₂ were resonantly excited with a laser beam of 577 nm, upconverted emissions were detected from the L (360 and 382 nm), K (418 nm), and I (432 nm) levels. Very weak upconverted emissions were detected when this system was irradiated with a near infrared laser. The numbers in parentheses are the wavelengths of the emissions.

This simultaneous collection of HIS spectral measurements aboard the ER-2 during STORM-FEST provided a means to explore calibration problems in the infrared bands of the Wildfire instrument. Large discrepancies in brightness temperatures were noted in Wildfire bands designed to sample the "wings" of the strong ozone absorption bands centered at 9.6 μm, where the atmospheric transmittance changes rapidly with wavelength. Examination of interchannel relationships in Wildfire data and
subsequent comparison to Wildfire data synthesized from the HIS measurements suggests that a wave-length shift in the channel spectral response from those determined in the laboratory may have occurred. Based on comparisons from several flights, this spectral shift has been empirically determined to be about 0.15 μm. It is speculated that this problem resulted from a slight misalignment of the spectrometer grating or other optical elements, or was a result of extreme range in temperatures experienced by the instrument throughout the course of an ER-2 flight. A consequence of this temperature fluctuation may be a change in the position of the grating in the optical path and could result in the variations in channel spectral response during flight. These findings for Wildfire may have significant bearing on future use of the MAS because of the similarities to the original Wildfire configuration.

TM-108440 March 1994
The Effects of Embedded Internal Delaminations on Composite Laminate Compression Strength; An Experimental Review. A.T. Nettles. Materials and Processes Laboratory. 94N-26127

Delaminations in laminated composite materials can degrade the compressive strength of these materials. Delaminations can form as a result of impact damage or processing flaws. In order to better understand the effects of these delaminations on the compressive behavior of laminated composite plates, programs have been conducted to assess the criticality of prescribed delaminations of known size, shape, and location on the compression strength of laminated composites. A review of these programs is presented along with highlights of pertinent findings from each.

TM-108441 March 1994

NASA has been progressively learning the design and performance of the Russian life support systems utilized in their Mir space station. In 1992 a plan was implemented to assess the benefits of the Mir-1 life support systems to the Freedom program. Three primary tasks focused on: (1) evaluating the operational Mir-1 support technologies and understanding if specific Russian systems could be directly utilized on the American space station and determine if Russian technology design information could prove useful in improving the current design of the planned American life support equipment, (2) evaluating ongoing Russian life support technology development activities to determine areas of potential long-term application to the U.S. space station, and (3) utilizing the expertise the Russians have gained with the long-term operation of their space station life support systems to evaluate the benefits to the current U.S. space station program which included the integration of the Russian Mir-1 designs with the U.S. designs to support a crew of six.

TM-108442 March 1994

One of the most critical components of a space suit is the gloves, yet gloves have traditionally presented significant design challenges. With continued efforts at glove development, a method for evaluating glove performance is needed. This paper presents a pressure-glove evaluation protocol. A description of this evaluation protocol and its development is provided. The protocol allows comparison of one glove design to another, or any one design to bare-handed performance. Gloves for higher pressure suits may be evaluated at current and future design pressures to drive out differences in performance due to pressure effects. Using this protocol, gloves may be evaluated during design to drive out design problems and determine areas for improvement, or fully mature designs may be evaluated with respect to mission requirements. Several different test configurations are presented to handle these cases. This protocol was run on a prototype glove. The prototype was evaluated at two operating pressures and in the unpressurized state, with results compared to bare-handed performance. Results and analysis from this test series was provided, as is a description of the configuration used for this test.

TM-108443 March 1994
Microbiology Report for the Stage 7 and Stage 8 Water Recovery Tests. M.C. Roman and S.A. Minton. Structures and Dynamics Laboratory. 94X-10202

The Water Recovery Test (WRT) Stage 7 and Stage 8 of the Environmental Control and Life
Support System (ECLSS) test program was conducted at NASA/Marshall Space Flight Center (MSFC). Assessments of the design and operation of a single-loop water recovery system, which combined the potable and hygiene water recovery loops used in previous WRT testing, was performed during the two test stages. Stage 7 operated for 59 days, December 4, 1991, to February 22, 1992. During each day of WRT stage 7, an average of 20 human test subjects generated wastewater from shower, hand wash, oral hygiene, and laundry activities. In addition, test subjects produced humidity condensate (during exercise), and donated urine. Stage 8 operated 84 days, July 14, 1992, to October 7, 1992. This stage was conducted in donor mode operation with no test subject reclaimed water usage. Stage 8 was conducted identically to stage 7 except for one important change in the system configuration. The potable water processor (PWP) feed sterilizer was by-passed throughout stage 8 testing to determine the impact on the subsystem performance and unibed life expectancy.

March 1994
Development of a New Seal for Use on Large Openings of Pressurized Spacecraft (Center Director's Discretionary Fund Project No. 92-11). B. Weddendorf. Structures and Dynamics Laboratory. 94N-27560

This report presents the results of the Center Director's Discretionary Fund project "Development of a New Seal for Use on Large Openings of Pressurized Spacecraft." The goal of this project was to design, build, and test an example of the seal invented by the author for use on Space Station Freedom and patented in 1991. The seal features a metallic spring core and replaceable elastomeric sealing elements. The metallic spring is designed to retain the sealing force of the elastomeric element against both sides of face seal gland for any specified amount of waviness or separation of the glands. A seal able to tolerate at least 1.3 mm (0.05 in) of flange distortion or separation and a test fixture of this seal which allowed direct comparison testing of O-rings were built. These designs were tested to compare leakage at different amounts of flange deflection. Results of the testing show the development seal exceeded its requirement to seal 1.3 mm of flange separation by 1 mm. This compared with the O-ring leakage increasing dramatically at 0.5 mm of separation. The development seal also leaked at a lower rate than the O-ring seals in all tests.
slowly turning the pump shafts before and after an engine firing. These signatures are then analyzed and compared to the original signatures to more accurately predict bearing wear.

TM-108448 April 1994

This report provides a description of the NASA Marshall Space Flight Center’s Solar Vector Magnetograph Facility and gives a summary of its observations and data reduction during June–October 1993. The systems that make up the facility are a magnetograph telescope, an H-α telescope, a Questar telescope, and a computer code.

TM-108449 April 1994
Ampoule Failure Sensor Time Response Testing—Experiment 1. M.L. Johnson and D.A. Watring. Astrionics and Space Sciences Laboratory. 94N-30199

The response time of an ampoule failure sensor exposed to a liquid or vapor gallium-arsenide (GaAs) is investigated. The experimental configuration represents the sample/ampoule cartridge assembly used in NASA’s Crystal Growth Furnace (CGF). The sensor is a chemical fuse made from a metal with which the semiconductor material reacts more rapidly than it does with the containing cartridge. For the III-IV compound of GaAs, a platinum metal was chosen based on the reaction of platinum and arsenic at elevated temperatures which forms a low melting eutectic. Ampoule failure is indicated by a step change in resistance of the failure sensor on the order of megohms. The sensors will increase the safety of crystal growth experiments by providing an indication that an ampoule has failed. Experimental results indicate that the response times (after a known ampoule failure) for the 0.003 and 0.010 inch ampoule failure sensors are 2.4 and 3.6 minutes, respectively. This ampoule failure sensor will be utilized in the CGF during the second United States Microgravity Laboratory Mission (USML-2) and is the subject of a NASA patent application.

TM-108450 April 1994

This document lists the significant publications and presentations of the Space Sciences Laboratory during the period January 1–December 31, 1993. Entries in the main part of the document are categorized according to NASA Reports (arranged by report number), Open Literature, and Presentations (arranged alphabetically by title). Also included for completeness is an Appendix (arranged by report number) listing preprints issued by the Laboratory during this reporting period. Some of the preprints have not been published; those already published are so indicated. Most of the articles listed under Open Literature have appeared in refereed professional journals, books, monographs, or conference proceedings. Although many published abstracts are eventually expanded into full papers for publications in scientific and technical journals, they are often sufficiently comprehensive to include the significant results of the research reported. Therefore, published abstracts are listed separately in a subsection under Open Literature. Questions or requests for additional information about the entries in this report should be directed to Tauna W. Moorehead (ES02; 544-7581) or to one of the authors. The organizational code of the cognizant SSL branch or office is given at the end of each entry.

TM-108451 April 1994
National Aerospace Plane (NASP) X–30 Natural Environment Requirements Document (Rev. I.0). Dale L. Johnson. Space Sciences Laboratory. 94X-10268

This document defines and summarizes the natural environment design criteria to be used in the design, operational planning, and testing of the proposed, experimental National Aerospace Plane (NASP) X–30 vehicle. Much of the atmospheric design criteria involves climatologies for the Edwards AFB, CA (proposed ) launch and landing site, as well as atmospheric design statistics pertaining to flight patterns around the CONUS and orbital/deorbital phases. A design risk of 5 percent or 1 percent is assumed for the proposed flight phases of the X–30 vehicle, as well as pre- and post-launch concerns.

TM-108452 April 1994
Vulnerability of Manned Spacecraft to Crew Loss From Orbital Debris Penetration. J.E. Williamsen. Structures and Dynamics Laboratory. 94N-30161
Orbital debris growth threatens the survival of spacecraft systems from impact-induced failures. Whereas the probability of debris impact and spacecraft penetration may currently be calculated, another parameter of great interest to safety engineers is the probability that debris penetration will cause actual spacecraft or crew loss. Quantifying the likelihood of crew loss following a penetration allows spacecraft designers to identify those design features and crew operational protocols that offer the highest improvement in crew safety for available resources.

Within this study, a Manned Spacecraft Crew Survivability (MSCSurv) computer model is developed that quantifies the conditional probability of losing one or more crew members, $P_{\text{loss/pen}}$, following the remote likelihood of an orbital debris penetration into an eight module space station. Contributions to $P_{\text{loss/pen}}$ are quantified from three significant penetration-induced hazards: pressure wall rupture (explosive decompression), fragment-induced injury, and "slow" depressurization. Sensitivity analyses are performed using alternate assumptions for hazard-generating functions, crew vulnerability thresholds, and selected spacecraft design and crew operations parameters. These results are then used to recommend modifications to the spacecraft design and expected crew operations that quantitatively increase crew safety from orbital debris impacts.

**TM-108453**

Root-Sum-Square Structural Strength Verification Approach. H.M. Lee. Structures and Dynamics Laboratory. 94N-30206

Utilizing a proposed fixture design or some variation thereof, this report presents a verification approach to strength test space flight payload components, electronics boxes, mechanisms, lines, fittings, etc., which traditionally do not lend themselves to classical static loading. The fixture, through use of ordered Euler rotation angles derived herein, can be mounted on existing vibration shakers and can provide an innovative method of applying single axis flight load vectors. The versatile fixture effectively loads protoflight or prototype components in all three axes simultaneously by use of a sinusoidal burst of desired magnitude at less than one-third the first resonant frequency. Cost savings along with improved hardware confidence are shown to be the potential, with the end product being an efficient way to verify experiment hardware for both random vibration and strength.

**TM-108454**

A Case Study of Analysis Methods for Large Deflections of a Cantilever Beam. L.D. Craig. Structures and Dynamics Laboratory. 94N-32903

A load case study of geometric nonlinear large deflections of a cantilever beam is presented. The bending strain must remain elastic. Closed form solution and finite element methods of analysis are illustrated and compared for three common load cases. A nondimensional monogram for each case is presented in the summary.

**TM-108456**

A User's Guide to the Trace Contaminant Control Simulation Computer Program. J.L. Perry. Structures and Dynamics Laboratory. 94N-33696

The Trace Contaminant Control Simulation computer program is a tool for assessing the performance of various trace contaminant control technologies for removing trace chemical contamination from a spacecraft cabin atmosphere. The results obtained from the program can be useful in assessing different technology combinations, system sizing, system location with respect to other life support systems, and the overall life cycle economics of a trace contaminant control system. The user's manual is extracted in its entirety from NASA TM-108409 to provide a stand-alone reference for using any version of the program. The first publication of the manual as part of TM-108409 also included a detailed listing of version 8.0 of the program. As changes to the code were necessary, it became apparent that the user's manual should be separate from the computer code documentation and be general enough to provide guidance in using any version of the program. Provided in the guide are tips for input file preparation, general program execution, and output file manipulation. Information concerning source code listings of the latest version of the computer program may be obtained by contacting the author.

**TM-108457**

Trace Contaminant Control Simulation Computer Program—Version 8.1. J.L. Perry. Structures and Dynamics Laboratory. 94N-33973

The Trace Contaminant Control Simulation computer program is a tool for assessing the performance of various process technologies for
removing trace chemical contamination from a spacecraft cabin atmosphere. Included in the simulation are chemical and physical adsorption by activated charcoal, chemical adsorption by lithium hydroxide, absorption by humidity condensate, and low- and high-temperature catalytic oxidation. Means are provided for simulating regenerable as well as nonregenerable systems. The program provides an overall mass balance of chemical contaminants in a spacecraft cabin given specified generation rates. Removal rates are based on device flow rates specified by the user and calculated removal efficiencies based on cabin concentration and removal technology experimental data. Versions 1.0 through 8.0 are documented in NASA TM-108409. TM-108409 also contains a source file listing for version 8.0. Changes to version 8.0 are documented in this technical memorandum and a source file listing for the modified version, version 8.1, is provided. Detailed descriptions for the computer program subprograms are extracted from TM-108409 and modified as necessary to reflect version 8.1. Version 8.1 supersedes version 8.0. Information on a separate user's guide is available from the author.

TM-108458 June 1994
Ampoule Failure Sensor Time Response Testing—Experiments 2 and 3. M.L. Johnson and D.A. Watring. Astrionics and Space Sciences Laboratory. 94N-36822

The response time of an ampoule failure sensor exposed to a liquid or vapor gallium-arsenide (GaAs) and the corresponding breach time of the containing cartridge is investigated. The experiments were conducted in niobium-hafnium (WC-103) cartridges with an exterior silicide coating. These cartridges were built to flight specifications that were used in NASA's Crystal Growth Furnace during the first United States Microgravity Laboratory (USML-1) mission. The ampoule failure sensor is a chemical fuse made from a metal with which the semiconductor material reacts more rapidly than it does with the containing cartridge. In these experiments, a platinum metal was used for the manufacture of the sensors. This technical report discusses the response time of two different sensor designs. The first design utilizes a helical wrapped wire and the second uses a single bare wire element. Experimental results indicate that both sensors are adequate in sensing the presence of molten or vapor GaAs with the latter having a 2-minute longer response time. In both experiments, the containing cartridge was breached within 185 minutes after ampoule rupture.

TM-108459 June 1994

Spacecraft thermal control is accomplished for many components through use of multilayer insulation systems, electrical heaters, and radiator systems. The heaters are commanded to maintain component temperatures within design specifications. The programmable heater control circuit (PHCC) was designed to obtain an effective and efficient means of spacecraft thermal control. The hybrid circuit provides use of control instrumentation as temperature data, available to the spacecraft central data system, reprogramming capability of the local microprocessor during the spacecraft's mission, and the elimination of significant spacecraft wiring. The hybrid integrated circuit has a temperature sensing and conditioning circuit, a microprocessor, and a heater power and control circuit. The device is miniature and housed in a volume which allows physical integration with the component to be controlled. Applications might include alternate battery-powered logic-circuit configurations. A prototype unit with appropriate physical and functional interfaces was procured for testing. The physical functionality and the feasibility of fabrication of the hybrid integrated circuit were successfully verified. The remaining work to develop a flight-qualified device includes fabrication and testing of a Mil-certified part. An option for completing the PHCC flight qualification testing is to enter into a joint venture with industry.

TM-108460 August 1994
Portable Color Multimedia Training Systems Based on Monochrome Laptop Computers (CBT-in-a-Briefcase), With Spinoff Implications for Video Uplink and Downlink in Spaceflight Operations (Center Director's Discretionary Fund Final Report, No. 91-16). D.W. Scott. Structures and Dynamics Laboratory. 94N-37556

This report describes efforts to use digital motion video compression technology to develop a highly portable device that would convert 1990–91
era IBM-compatible and/or Macintosh notebook computers into full-color, motion-video capable multimedia training systems. An architecture was conceived that would permit direct conversion of existing laser-disk-based multimedia courses with little or no reauthoring. The project did not physically demonstrate certain critical video keying techniques, but their implementation should be feasible. This investigation of digital motion video has spawned two significant spaceflight projects at MSFC: one to downlink multiple high-quality video signals from Spacelab, and the other to uplink video conference-quality video in real-time and high quality video offline, plus investigate interactive, multimedia-based techniques for enhancing onboard science operations. Other airborne or spaceborne spinoffs are possible.

ZrF$_4$-BaF$_2$-LaF$_3$-AlF$_3$-NaF (ZBLAN) optical fiber was flown onboard the NASA’s KC-135 microgravity aircraft to determine the effects of microgravity on crystal growth in this material. Fiber samples were placed in evacuated quartz ampoules and heated to the crystallization temperature in 0, 1, and 2g. The 1 and 2g samples were observed to slump and crystallize. The 0g samples showed no evidence of crystallization.

The Retarding Ion Mass Spectrometer (RIMS) experiment onboard the Dynamics Explorer 1 (DE 1) satellite was designed to perform energy and mass-per-charge analysis on low-energy ions (<50 eV) with mass/charge ratios ranging from 1 to 40 amu/Z. The DE 1 satellite, carrying the RIMS experiment, was launched into an elliptical polar orbit on August 3, 1981. The ~7.5 hour orbit has perigee of 675 km altitude and apogee of 24,875 km altitude. This document, and those that follow in this series, contains summary RIMS data spectrograms for each orbit for which RIMS data are available. The RIMS instrument began returning science data on day 280 of 1981 and continued to return usable data until the end of the DE mission in March 1991. It should be noted that studies of the RIMS data set should be conducted only with a thorough awareness of the material described in the introduction section presented here, or in collaboration with a scientist familiar with RIMS data analysis.

Finite Element Analysis of a Composite Wheelchair Wheel Design. R. Ortega. Structures and Dynamics Laboratory.

The finite element analysis of a composite wheelchair wheel design is presented. The design is the result of a technology utilization request. The designer’s intent is to soften the riding feeling by incorporating a mechanism attaching the wheel rim to the spokes that would allow considerable deflection upon compressive loads. A finite element analysis was conducted to verify proper structural function. Displacement and stress results are presented and conclusions are provided.

For three decades, magnetospheric field and plasma measurements have been made by diverse instruments flown on spacecraft in many different orbits, widely separated in space and time, and under various solar and magnetospheric conditions. Scientists have used this information to piece together an intricate, yet incomplete view of the magnetosphere. A simultaneous global view, using various light wavelengths and energetic neutral atoms, could reveal exciting new data and help explain complex magnetospheric processes, thus providing us with a clear picture of this region of space.

The George C. Marshall Space Flight Center (MSFC) is responsible for defining the IMI mission which will study this region of space. NASA’s Space Physics Division of the Office of Space Science placed the IMI third in its queue of Solar Terrestrial Probe missions for launch in the 1990’s. A core instrument complement of three images (with the potential addition of one or more mission enhancing instruments) will fly in an elliptical, polar Earth orbit with a apogee of 44,600 km and a perigee of 4,800 km. This paper will address the
mission objectives, spacecraft design considerations, interim results of the MSFC concept definition study, and future plans.

TM-108465 August 1994

Fabrication of a lunar ceramic was conducted according to a statistically designed experiment. The method of cold pressing was used since the consumption of electrical energy is kept to a minimum, a priority in the lunar environment. This traditional fabrication technique also provides an initial data source on which further investigations can be based. Results obtained from using 2 percent binder, a cold pressing pressure of 276 MPa, and 24 hours sintering time yielded the greatest compressive strength of 247 MPa. Analysis of each variable’s influence on the compressive strength is also presented.

TM-108466 September 1994

Phthalocyanines have been used as a pigment in coatings and related applications for many years. These pigments are some of the most stable organic pigments known. The phthalo blue and green pigments have been shown to be ultraviolet (UV) stable and thermally stable to over 400 °C. These phthalocyanines are both a semiconductor and photoconductor, exhibiting catalytic activity and photostabilization capability of polymers. Many metal free and metallic phthalocyanine derivatives have been prepared. Development of the new classes of phthalocyanine pigment could be used as coating on NASA spacecraft material such as glass to decrease the optical degradation from UV light, the outside of the space station modules for UV protection, and coating on solar cells to increase lifetime and efficiency.

TM-108467 September 1994

The feasibility of using densification or subcooling with respect to standard temperature propellants on the Space Transportation System (STS) in order to achieve a payload gain is discussed in this report. The objective is to determine the magnitude of the payload gain and to identify any system impacts to the space shuttle on either flight systems or ground systems. Results show that a payload benefit can be obtained by subcooling the liquid hydrogen (LH2) from a nominal temperature of 36.4 to 28.5 °R and by subcooling the liquid oxygen (LO2) from a nominal temperature of 164 °R to either 132.1 or 141.4 °R. When the propellants are subcooled to 28.5 and 132.1 °R for the LH2 and LO2, respectively, a maximum payload gain of 7,324 lb can be achieved, and when the propellants are subcooled to 28.5 and 141.5 °R for the LH2 and LO2, respectively, a maximum payload gain of 6,841 lb can be achieved. If the LH2 is subcooled to 28.5 °R while the LH2 and LO2 remains at the nominal conditions, a maximum payload gain of 1,303 lb can be achieved.

TM-4511 August 1993
Terrestrial Environment (Climatic) Criteria Guidelines for Use in Aerospace Vehicle Development, 1993 Revision. D.L. Johnson, Editor. Space Sciences Laboratory. 94N-14824

This document provides guidelines on terrestrial environment data specifically applicable in the development of design requirements/specifications for NASA aerospace vehicles and associated equipment development. The primary geographic areas encompassed are the John F. Kennedy Space Center, FL; Vandenberg AFB, CA; Edwards AFB, CA; Michoud Assembly Facility, New Orleans, LA; John C. Stennis Space Center, MS; Lyndon B. Johnson Space Center, Houston, TX; and the White Sands Missile Range, NM. In addition, a section has been included to provide information on the general distribution of natural environmental extremes in the conterminous United States that may be needed to specify design criteria in the transportation of space vehicle subsystems and components. A summary of climatic extremes for worldwide operational needs is also included. Although not considered as a specific vehicle design criterion, a section on atmospheric attenuation has been added since sensors on certain Earth orbital experiment missions are influenced by the Earth’s atmosphere. This document presents the latest available information on probable climatic extremes and supersedes information presented in TM X-64589, TM X-64757, TM X-78118, and TM-82473. Information is included on atmospheric chemistry, seismic criteria, and on a mathematical model to predict atmospheric dispersion of
aerospace engine exhaust cloud rise and growth. There is also a section on atmospheric cloud phenomena. The information in this report is recommended for use in the development of aerospace vehicle and associated equipment design and operational criteria, unless otherwise stated in contract work specifications. The environmental data in this report are primarily limited to information below 90 km.

TM-4527  June 1994

This document provides definitions of the natural near-Earth space environment suitable for use in the initial development/design phase of any space vehicle. The natural environment includes the neutral atmosphere, plasma, charged particle radiation, electromagnetic radiation (EMR), meteoroids, orbital debris, magnetic field, physical and thermal constants, and gravitational field. Communications and other unmanned satellites operate in geosynchronous-Earth orbit (GEO); therefore, some data are given for GEO, but emphasis is on altitudes from 200 to 1,000 km (low-Earth orbit (LEO)). This document does not cover the induced environment or other effects resulting from presence of the space vehicle. Manmade factors are included as part of the ambient natural environment; i.e., orbital debris and radio frequency (RF) noise generated on Earth, because they are not caused by the presence of the space vehicle but form part of the ambient environment that the space vehicle experiences.

TM-4594  April 1994

The Lunar Ultraviolet Telescope Experiment (LUTE) is a 1-meter telescope for imaging from the lunar surface of the ultraviolet spectrum between 1,000 and 3,500 angstroms. There have been several endorsements of the scientific value of a LUTE. In addition to the scientific value of LUTE, its educational value and the information it can provide on the design of operating hardware for long-term exposure in the lunar environment are important considerations.

This report provides the results of the LUTE phase A activity begun at the George C. Marshall Space Flight Center in early 1992. It describes the objective of LUTE (science, engineering, and education), a feasible reference design concept that has evolved, and the subsystem trades that were accomplished during the phase A.
NASA TECHNICAL PAPERS

TP-3421 October 1993
Prioritization Methodology for Chemical Replacement. W. Cruit, S. Schutzenhofer, B. Goldberg, and K. Everhart. NASA Operational Environment Team. 94N-15723

This project serves to define an appropriate methodology for effective prioritization of efforts required to develop replacement technologies mandated by imposed and forecast legislation. The methodology used is a semiquantitative approach derived from quality function deployment techniques (QFD Matrix). This methodology aims to weigh the full environmental, cost, safety, reliability, and programmatic implications of replacement technology development to allow appropriate identification of viable candidates and programmatic alternatives. The results are being implemented as a guideline for consideration for current NASA propulsion systems.

TP-3432 November 1993
Total Systems Design Analysis of High Performance Structures. V. Verderaime. Structures and Dynamics Laboratory. 94N-20141

Designer-control parameters were identified at interdiscipline interfaces to optimize structural systems performance and downstream development and operations with reliability and least life-cycle cost. Interface tasks and iterations are tracked through a matrix of performance disciplines integration versus manufacturing, verification, and operations interactions for a total system design analysis. Performance integration tasks include shapes, sizes, environments, and materials. Integrity integrating tasks are reliability and recurring structural costs. Significant interface designer control parameters were noted as shapes, dimensions, probability range factors, and cost. Structural failure concept is presented, and first-order reliability and deterministic methods, benefits, and limitations are discussed. A deterministic reliability technique combining benefits of both is proposed for static structures which is also timely and economically verifiable. Though launch vehicle environments were primarily considered, the system design process is applicable to any surface system using its own unique filed environments.

TP-3434 November 1993

Probabilistic structural analyses and design methods are steadily gaining acceptance within the aerospace industry. The safety factor approach to design has long been the industry standard, and is believed by many to be overly conservative, and thus costly. A probabilistic approach to design may offer substantial cost savings. This report summarizes several probabilistic approaches; the probabilistic failure analysis (PFA) methodology developed by Jet Propulsion Laboratory, fast probability integration (FPI) methods, the NESSUS finite element code, and response surface methods. Example problems are provided to help identify the advantages and disadvantages of each method.

TP-3442 December 1993
Analysis and Test of Low Profile Aluminum Aerospace Tank Dome. R. Ahmed and J.M. Wilhelm. Structures and Dynamics Laboratory. 94N-23294

In order to increase the structural performance of cryogenic tanks, the aerospace industry is beginning to employ low-profile bulkheads in new generation launch vehicle designs. This report details the analysis and test of one such dome made from 2219 aluminum. Such domes have two potential failure modes under internal pressure, general tensile failure and hoop compression buckling (in regions near the Equator). The test determined the buckling load and ultimate tensile load of the hardware and showed that both compared well with the analysis predictions. This effort was conducted under the auspices of NASA and the General Dynamics Cryogenic Tank Technology Program (CTTP).

TP-3457 January 1994
CORSS: Cylinder Optimization of Rings, Skin, and Stringers. J. Finckenor, P. Rogers, and N. Otte. Structures and Dynamics Laboratory. 94N-24727

Launch vehicle designs typically make extensive use of cylindrical skin stringer construction. Structural analysis methods are well developed for preliminary design of this type of construction. This report describes an automated, iterative method to obtain a minimum weight preliminary design. Structural optimization has been researched extensively, and various programs have been written for this purpose. Their complexity and ease of use depends on their generality, the failure modes.
considered, the methodology used, and the rigor of the analysis performed. This computer program employs closed-form solutions from a variety of well-known structural analysis references and joins them with a commercially available numerical optimizer called the "Design Optimization Tool" (DOT).

Any ring and stringer stiffened shell structure of isotropic materials that has beam type loading can be analyzed. Plasticity effects are not included. It performs a more limited analysis than programs such as PANDA, but it provides an easy and useful preliminary design tool for a large class of structures.

This report briefly describes the optimization theory, outlines the development and use of the program, and describes the analysis techniques that are used. Examples of program input and output, as well as the listing of the analysis routines, are included.

TP-3458 January 1994
Results of a Laboratory Experiment That Tests Rotating Unbalanced-Mass Devices for Scanning Gimbaled Payloads and Free-Flying Spacecraft (CDDF Final Report No. 92-02). D.C. Alhorn and M.E. Polites. Astrionics Laboratory and Structures and Dynamics Laboratory. 94N-23574

Rotating unbalanced-mass (RUM) devices are a new way to scan space-based, balloon-borne and ground-based gimbaled payloads, like x-ray and gamma-ray telescopes. They can also be used to scan free-flying spacecraft. Circular scans, linear scans, and raster scans can be generated. A pair of RUM devices generates the basic scan motion and an auxiliary control system using torque motors control moment gyros, or reaction wheels keeps the scan centered on the target and produces some complementary motion for raster scanning. Previous analyses and simulation results show that this approach offers significant power savings compared to scanning only with the auxiliary control system especially with large payloads and high scan frequencies. However, these claims have never been proven until now. This paper describes a laboratory experiment which tests the concept of scanning gimbaled payload with RUM devices. A description of the experiment is given and test results that prove the concept are presented. The test results are compared with those from a computer simulation model of the experiment and the differences are discussed.

TP-3463 February 1994
Thermocapillary Flow With Evaporation and Condensation and Its Effect on Liquid Retention in Low-G Fluid Acquisition Devices, MSFC Center Director's Discretionary Fund Final Report, Project No. 91-15. G.R. Schmidt. Propulsion Laboratory. 94N-27639

The steady motion, thermal and free surface behavior of a volatile, wetting liquid in microgravity are studied using scaling and numerical techniques. The objective is to determine whether the thermocapillary and two-phase convection arising from thermodynamic nonequilibrium along the porous surfaces of spacecraft liquid acquisition devices could cause the retention failures observed with liquid hydrogen and heated vapor pressurant. The study also examines why these devices seem immune to retention loss when pressurized with heated helium or heated directly through the porous structure. Results show that highly wetting fluids exhibit large negative and positive dynamic pressure gradients toward the meniscus interface when superheated and subcooled, respectively. With superheating, the pressure variation and recoil force arising from liquid/vapor phase change exert the same influence on surface morphology and promote retention. With subcooling, however, the pressure distribution produces a suction that degrades mechanical equilibrium of the surface. This result indicates that thermocapillary-induced deformation arising from subcooling and condensation is the likely cause for retention loss. In addition, increasing the level of nonequilibrium by reducing accommodation coefficient suppresses deformation and explains why this failure mode does not occur in instances of direct screen heating or pressurization with a heated inert gas.

TP-3488 May 1994
Aerodynamic Characteristics of the National Launch System (NLS) 1½ Stage Launch Vehicle. A.M. Springer and D.C. Pokora. Structures and Dynamics Laboratory. 94N-37577

The National Aeronautics and Space Administration (NASA) is studying ways of assuring more reliable and cost effective means to space. One launch system studied was the NLS which included the 1½ stage vehicle. This document encompasses the aerodynamic characteristics of the 1½ stage vehicle. To support the detailed configuration definition, two wind tunnel tests were conducted in the NASA Marshall Space Flight Center's 14×14-Inch Trisonic Wind Tunnel during 1992. The tests were a static stability and a pressure test, each utilizing 0.004 scale models. The static stability test resulted in the forces and moments acting on the vehicle. The
aerodynamics for the reference configuration with and without feedlines and an evaluation of three proposed engine shroud configurations were also determined. The pressure test resulted in pressure distributions over the reference vehicle with and without feedlines including the reference engine shrouds. These pressure distributions were integrated and balanced to the static stability coefficients resulting in distributed aerodynamic loads on the vehicle. The wind tunnel tests covered a Mach range of 0.60 to 4.96. These ascent flight aerodynamic characteristics provide the basis for trajectory and performance analysis, loads determination, and guidance and control evaluation.

The Corrosion Protection of Several Aluminum Alloys By Chromic Acid and Sulfuric Acid Anodizing. M.D. Danford. Materials and Processes Laboratory.  94N-37578

The corrosion protection afforded 7075-T6, 7075-T3, 6061-T6, and 2024-T3 aluminum alloys by chromic acid and sulfuric acid anodizing was examined using electrochemical techniques. From these studies, it is concluded that sulfuric acid anodizing provides superior corrosion protection compared to chromic acid anodizing.

Universal First-Order Reliability Concept Applied to Semistatic Structures. V. Verderaime. Structures and Dynamics Laboratory.

A reliability design concept was developed for semistatic structures which combines the prevailing deterministic method with the first-order reliability method. The proposed method surmounts deterministic deficiencies in providing uniformly reliable structures and improved safety audits. It supports risk analyses and reliability selection criterion. The method provides a reliability design factor derived from the reliability criterion which is analogous to the current safety factor for sizing structures and verifying reliability response. The universal first-order reliability method should also be applicable for air and surface vehicles semistatic structures.

TP-3501  
Illustrated Structural Application of Universal First-Order Reliability Method. V. Verderaime. Structures and Dynamics Laboratory.

The general application of the proposed first-order reliability method was achieved through the universal normalization of engineering probability distribution data. The method superimposes prevailing deterministic techniques and practices on the first-order reliability method to surmount deficiencies of the deterministic method and provide benefits of reliability techniques and predictions. A reliability design factor is derived from the reliability criterion to satisfy a specified reliability and is analogous to the deterministic safety factor. Its application is numerically illustrated on several practical structural design and verification cases with interesting results and insights. Two concepts of reliability selection criteria are suggested. Though the method was developed to support affordable structures for access to space, the method should also be applicable for most high-performance air and surface transportation systems.

Damage Tolerance of Candidate Thermoset Composites for Use on Single Stage to Orbit Vehicles. A.T. Nettles, D. Lance, and A. Hodge. Materials and Processes Laboratory.

Four fiber/resin systems were compared for resistance to damage and damage tolerance. One toughened epoxy and three toughened bismaleimide (BMI) resins were used, all with IM7 carbon fiber reinforcement. A statistical design of experiments technique was used to evaluate the effects of impact energy, specimen thickness, and tup diameter on the damage area as computed by C-scans, and residual compression-after-impact (CAI) strength. Results showed that two of the BMI systems sustained relatively large damage zones, yet had an excellent retention of CAI strength.

September 1994  

A major difficulty associated with $H_{\infty}$ and $\mu$-synthesis methods is the order of the resulting compensator. Whereas model and/or controller reduction techniques are sometimes applied, performance and robustness properties are not preserved. By directly constraining compensator order during the optimization process, these properties are better preserved, albeit at the expense of computational complexity. This paper presents a novel homotopy algorithm to synthesize fixed-order mixed $H_2/H_{\infty}$ compensators. Numerical results are presented for a four-disk
flexible structure to evaluate the efficiency of the algorithm.

TP-3508 September 1994
An Inelastic Analysis of a Welded Aluminum Joint. R.E. Vaughan. Structures and Dynamics Laboratory.

Butt-weld joints are most commonly designed into pressure vessels which then become as reliable as the weakest increment in the weld chain. In practice, weld material properties are determined from tensile test specimen and provided to the stress analyst in the form of a stress versus strain diagram. Variations in properties through the thickness of the weld and along the width of the weld have been suspect but not explored because of inaccessibility and cost.

The purpose of this study is to investigate analytical and computational methods used for analysis of welds. The weld specimens are analyzed using classical elastic and plastic theory to provide a basis for modeling the inelastic properties in a finite-element solution. The results of the analysis are compared to experimental data to determine the weld behavior and the accuracy of prediction methods. The weld considered in this study is a multiple-pass aluminum 2219-T87 butt weld with thickness of 1.40 in.

The weld specimen is modeled using the finite-element code ABAQUS. The finite-element model is used to produce the stress-strain behavior in the elastic and plastic regimes and to determine Poisson's ratio in the plastic region. The value of Poisson's ratio in the plastic regime is then compared to experimental data. The results of the comparisons are used to explain multipass weld behavior and to make recommendations concerning the analysis and testing of welds.

MSFC PAPERS CLEARED FOR PRESENTATION
(Available only from authors. Dates are presentation dates.)

ABDELDAYEM, H. ES76
BANKS, C.
HICKS, R.
PENN, B.G.
FRAZIER, D.O.
Large Third-Order Nonlinearities of Metal-Free Phthalocyanines Films. For presentation at the OSA Annual Meeting, Dallas, TX, October 2–7, 1994.

ABDELDAYEM, H. ES74
FRAZIER, D.O.
ET AL.
Polydiacetylenes: Excellent Candidates as Nonlinear Optical Material. For presentation at the 1993 OSA, Toronto, Canada, October 3–8, 1993.

ABDELDAYEM, H. ES76
WITHEROW, W.K.
PENN, B.
FRAZIER, D.O.
Novel Phenomenon of CW Laser Fanning in Organic Solutions. For publication in Optical Letters, Washington, DC.

ABDELDAYEM, H. ES74
WITHEROW, W.
PENN, B.
FRAZIER, D.O.

ADAMS, A.M. PS05

ASAKIMORI, K. ES64
BURNETT, T.H.

CHERRY, M.L.
CHRISTL, M.J.
MOON, K.H.

AUSTIN, R.E. PT01
COOK, S.A.
Single Stage to Orbit Rocket: The Next Generation of Space Transportation. For publication in Aerospace American.

AXFORD, W.I. ES82
SUESS, S.T.
The Heliosphere. For publication in EOS, Transactions, American Geophysical Union, Washington, DC.

BANKSTON, C.D. EB53

BARRET, C. ED15

BARRETT, E.C. ES44
DODGE, J.
GOODMAN, H.M.
JANOWIAK, J.
KIDD, C.
SMITH, E.A.
The First Wetnet Precipitation Intercomparison Project. For publication in Remote Sensing Reviews, Reading, United Kingdom.

BARRETT, E.C. ES42
ADLER, R.F.
ARPE, K.
BAUER, P.
BERG, W.
ET AL.
The First Wetnet Precipitation Intercomparison Project (PIP-1): Interpretation of Results.
For publication in Remote Sensing Reviews, New York, NY.

BARRY, R.G. ES42
SCHARFEN, G.F.
KNOWLES, K.W.
GOODMAN, S.J.

BASKARAN, S. ES76
NOEVER, D.
SCHUSTER, P.

BASKARAN, S. ES76
NOEVER, D.

BATTISTA, B.F. (Sverdrup)
CHESSER, B.L.
MAJUMDAR, A.K.
NGUYEN, D.
OWEN, J.W. ED64

BAUGHER, C.R. ES75
RAMACHANDRAN, N.
Basic Features of the STS/Spacelab Vibration Environment. For presentation at the 24th ICES and 5th European Symposium on Space Environmental Control Systems, Friedrichshafen, Germany, June 20–23, 1994.

BERNHARDT, P.A. ES53
SIEFRING, C.L.
RODRIGUEZ, P.
HAAS, D.G.
POLLOCK, C.J.

ET AL.
The Ionospheric Focused Heating (IFH) Experiment. For publication in the Journal of Geophysical Research, Washington, DC.

BESHEARS, R.D. EH13
HEDIGER, L.H.

BIANCA, C.J. ED21
GREENBERG, H.S.
JOHNSON, S.E.
Reusable LH2 Tank Technology Demonstration Through Ground Test. For presentation at the AIAA Space Programs and Technologies Conference, Huntsville, AL, September 27–29, 1994.

BIAO, Y. ES75
AZOULAY, M.
GEORGE, M.A.
BURGER, A.
COLLINS, W.E.
ET AL.

BIFANO, T.G. (Boston University)
DRUEDING, T.W.
FAWCETT, S.C. EB53
Contouring Algorithm for Ion Figuring. For publication in Precision Engineering, Journal of ASPE.

BLAKESLEE, R. ES43
BAILEY, J.
CHRISTIAN, H.

BODIFORD, M.P. EO38
Standardization of CCSDS Packet User Data Telemetry Construction Techniques. For presentation at the 1994 International

BOND, R. (IIT Research Institute)
MALONE, T.W.
RYBICKI, D.J. (Martin Marietta)

BOOTHE, R.E.

BORDELON, W.J.
MINOR, J.L.
NESMAN, T.E.

BRUNTY, J.
CHRISTENSEN, E. (Sverdrup)
CLARK, K.
FRADY, G.
RAYBURN, J.

BUCY, R.P.
PANOSKALTSIS-MORTARI, A.
HUANG, G.-Q.
LI, J.
KARR, L.
ET AL.
Heterogeneity of Single-Cell Cytokine Gene Expression in Clonal T Cell Populations. For publication in the Journal of Experimental Medicine, New York, NY.

BUECHLER, D.
CHRISTIAN, H.J.
GOODMAN, S.J.

BUCKLEY, A.P.

BUCKLEY, A.P.

BUCKLEY, A.P.
JOHNSON, C.D. (UAH)

BUCKLEY, A.P.
PATTERSON, A.F.
ANDERSON, J.B.
DRISKILL, T.C.

BURGESS, F. (USBI)
COSBY, S.
HOPPE, D.

BURNS, H.D.
Surface Contamination Analysis Team Overview. For presentation at the Aerospace Environmental Technology Conference, Huntsville, AL, August 10–11, 1994.

BURSEY, R. (United Technologies)
HALUCK, D.
THOM, R.
Incorporation of Silicon Nitride Rolling Elements Into the Pratt and Whitney High Pressure Oxidizer Turbopump for the Space Shuttle Main Engine. For presentation at the 1994 Conference
CAMPBELL, J. ES65

CAMPINS, H.
TELESKO, C.
OSIP, D.
RIEKE, G.
RIEKE, M.
SCHULZ, B.
The Color Temperature of (2060) Chiron: A Warm and Small Nucleus. For publication in the Astronomical Journal, Seattle, WA.

CANABAL, F., III. ED32

CARTER, D.C. ES76
RUKER, F.
HO, J.X.
LIM, K.
KEELING, K.
GILLILAND, G.
JI, X.

CAUZZI, G. ES82
FALCHI, A.
FALCIANI, R.
SMALDONE, L.A.
SCHWARTZ, R.
HAGYARD, M.
Coordinated Studies of Solar Activity Phenomena. For publication in Astronomy and Astrophysics, Reinhold, NY.

CHANDLER, M.O. ES83

CHANG, T.
TORR, M.R.
TORR, D.G.
RICHARDS, P.G.
The N2 Lyman Birge Hopfield Bands as Measured by the Imaging Spectrometric Observatory From ATLAS-1. For presentation at the American Geophysical Union Spring 1994 Meeting, Baltimore, MD, May 23–27, 1994.

CHEN, K.-T.
GEORGE, M.A.
ZHANG, Y.
BURGER, A.
SU, C.-H.
SHA, Y.-G.
GILLIES, D.C.
LEHOCZKY, S.L.

CHEN, K.T.
GEORGE, M.A.
ZHANG, Y.
BURGER, A.
ET AL.

CHEN, P.S. EH23
SANDERS, J.H.
LIAW, Y.K.
ZIMMERMAN, F.
Ductility Degradation of VPS NARloy-Z at Elevated Temperatures. For publication in Materials Science and Engineering, Long Island, NY.

CHEN, P.S. EH24
PANDA, B.
BHAT, B.N.
Elemental Partitioning in γ and γl as Used to Develop Hydrogen-Resistant Iron-Base Superalloys. For publication in Metallurgical Transactions.
BHAT, B.N.
Chemical Compatibility of Cast Waspaloy Composites Reinforced With Tungsten Wires.

CHOU, L.C.
DENG, Z.-T.
LIAW, G.-S.
Comparison of Shock Wave Structures by Solving Burnett and Boltzmann Equations.
For presentation at the AIAA/ASME Sixth Joint Thermophysics and Heat Transfer Conference,

CHOW, A.S.
MO, J.D. (Memphis State University)
Three-Dimensional Flow Modeling Inside SSME Preburner.

CHRISTENSEN, E.
CLARK, K.
BRUNTY, J.
FRADY, G.
RAYBURN, J.
System Level Structural Optimization of Launch Vehicles.
For presentation at the Fifth AIAA Symposium on Multidisciplinary Analysis and Optimization,
Panama City, FL, September 7–9, 1994.

CHRISTIAN, H.J.
The Optical Transient Detector.

COLE, H.J.
ASHLEY, P.R.
CITES, J.S.

Diffractive Optical Components for Fiber-to-Waveguide Couplers.
For presentation at the 1994 International Symposium on Optics, Imaging, and Instrumentation,

COMFORT, R.H.
RICHARDS, P.G.
CRABEN, P.D.

CHANDLER, M.O.
Problems With Thermal Conductivity in Simulating Ion Temperatures in Low Density Flux Tubes.

CORDER, E.L.
The Development of the Solar X-Ray Imager (SXI) Camera.
For presentation at the OE/Aerospace Sensing Conference, Orlando, FL, April 5–6, 1994.

CRABB, T.M. (Orbital Technologies Corp.)
HINMAN-SWEENEY, E.
EB62
Smart Sensing for Space Processing and Automation.
For presentation at the Conference on NASA/Centers for Commercialization and Development of Space,
Albuquerque, NM, January 8–12, 1995.

CRABEN, P.D.

COMFORT, R.H.
RICHARDS, P.G.

GREBOWSKY, J.
Comparisons of Modeled N+, O+, H+, and He+ in the Midlatitude Ionosphere With Mean Densities and Temperatures From Atmospheric Explorer.
For publication in the Journal of Geophysical Research, Washington, DC.

CREECH, S.D.
PP03
Cost Results of NASA’s Access to Space Study.
For presentation at the Workshop on Space Launch Systems Cost, Risk Reduction, and Economics,
Munich, Germany, June 16, 1994.

CRYSTER, T.

NANDI, G.C.
HINMAN-SWEENEY, E.M.

DWIVEDI, S.N.
LYONS, D.W.
Dynamics, Control, and Finite Element Design of a Research Testbed for Manipulator-Coupled
Spacecraft. For publication in the Journal of Robotic Systems, Riverside, CA.

CRYSTER, T. EB62
NANDI, G.C.
HINMAN-SWEENEY, E.M.
DWIVEDI, S.N.
LYONS, D.W.

CURREN, P.A. ES75
KAUKLER, W.F.
ROSENBERGER, F.

CURREN, P.A. ES75
Preliminary Science Results for the United States Microgravity Payload Mission 2. For presentation at the Sixth Annual Spacebound Conference, Montreal, Quebec, Canada, May 18-20, 1994.

DAKHOUL, Y. (Sverdrup)
KUMAR, G.
GRIFFITH, D.
WARSII, S.
KANIA, L.
VU, B.W. ED32

DANIEL, R.L. (Rocketdyne)
SANDERS, H.L.
MENDREK, M.J. EH24

DARBY, S.P. EH01

DATLOWE, D.W. ES66
IMHOF, W.L.
FISHMAN, G.J.
FINGER, M.H.
Compton Gamma Ray Observatory/BATSE Observations of Energetic Electrons Scattered by Cyclotron Resonance With Waves From Powerful VLF Transmitters. For publication in the Journal of Geophysical Research, Washington, DC.

DAVIS, J. ES82
BAGDIGIAN, D.
BUSCHMANN, S.
GRAIG, G.
RUSSELL, J.
WALLACE, K.

DAVIS, J. ES52
BAGDIGIAN, D.
BUSCHMANN, S.
GRAIG, G.
RUSSELL, J.
WALLACE, K.

DAVIS, J. ES52
BAGDIGIAN, D.
BUSCHMANN, S.
GRAIG, G.
RUSSELL, J.
WALLACE, K.

DELCOURT, D.C. (CNRS)
MARTIN, R.F.
SAUVAUD, J.A.
MOORE, T.E. ES53
Centrifugal Trapping in the Magnetotail. For publication in Geophysical Research Letters, Washington, DC.

DELCOURT, D.C. ES53
MOORE, T.E.
CHAPPELL, C.R.

DELCOURT, D.C. ES53
SAUVAUD, J.A.
MOORE, T.E.
Centrifugal Flow Reversal in the Equatorial Magnetosphere. For publication in the American Geophysical Union Monograph, Washington, DC.

DELCOURT, D.C. (CRPE/CNRS)
SAUVAUD, J.A. (CESR/CNRS)
MOORE, T.E. ES53
Polar Wind Ion Dynamics in the Magnetotail. For publication in the Journal of Geophysical Research, Washington, DC.

DENG, Z.-T. ED33
LIAW, G.-S.
CHOU, L.C.

DERRICKSON, J.H. ES64
EBY, P.B.
FOUNTAIN, W.F.
PARNELL, T.A.
WATTS, J.W.
MOON, K.H.
ET AL.

Direct Electron Pairs Along Heavy Ion Tracks. For presentation at the Korean Physical Society Meeting, Taigu, Korea, October 23–24, 1993.

DILL, K.M. (Sverdrup)
BALLARD, R.O.
McINTYRE, S.D. EP21

DILLS, M. (United Technologies)
KEGLEY, J.
MACLAUGHLIN, S.
SCHRODER, M.
BENJAMIN, T. ED32

DITTMAR, M.L. EO23
HALE, J.P.

DODGE, J.C. ES44
GOODMAN, H.M.
The WetNet Project. For publication in the Journal of Remote Sensing Reviews, Reading, United Kingdom.

DRUEDING, T.W. (Boston University) EB53
BIFANO, T.G.
FAWCETT, S.C.

DUGAL-WHITEHEAD, N.R. EB72
MOORES, G. (Micon Eng.)
Reliability of Series Arc Protection on PMAD Test Bed. For presentation at the Intersociety

DUMBACHER, D.L.  
KLEVATT, P.L.  
DC-XA—First Step to a Reusable Launch Vehicle. For presentation at the AIAA Space Programs and Technologies Conference, Huntsville, AL, September 27, 1994.

DUNCAN, E.F.  
SCHLAGHECK, R.A.  
CRYSEL, W.B.  
(Boeing)  
RIDER, J.W.  
(Teledyne Brown)  

DUNCAN, E.F.  
SCHLAGHECK, R.  
CRYSEL, W.B.  
(Boeing)  
RYDER, J.W.  

EAGLES, D.M.  
Possible High-Current Superconductivity at Room Temperature in Oxidized Polypropylene and Other Quasi One-Dimensional Systems. For publication in Physica C, Amsterdam, The Netherlands.

ELROD, M.  

EMSLIE, A.G.  
HORACK, J.M.  

ENGELHAUPT, D.  
FAWCETT, S.C.  
ROOD, R.W.  

ENGLER, T.O.  
EO37  

EWING, F.  
FORSYTHE, E.  
PUSEY, M.  
Orthorhombic Lysozyme Solubility. For publication in Acta Crystallographica D, Munksgaard, Noerre Soegade 35, DK-1370, Copenhagen, Denmark.

FAJARDO-ACOSTA, S.B.  
TELESCO, C.M.  
KNACKE, R.F.  

FAWCETT, S.C.

High Resolution Imaging of Rain Systems With
the Advanced Microwave Precipitation
Radiometer. For publication in the Journal
of Atmospheric and Oceanic Technology, Boston,
MA.

SPENCER, R.W.
GRIFIN, V.L.
Research Opportunities With the Pathfinder
MSU Daily Temperature Data Sets. For presentation
at the Seventh AMS Satellite Conference,

SPENCER, R.W.
GRIFIN, V.L.
Oscillations in Daily Tropical Average Rainfall,
Temperature, and OLR. For presentation at the
AMS Annual Meeting, Nashville, TN, January

SPENCER, S.
CLAR, D.
PARNELL, T.A.
The Design and Analysis of the Thermal Control
System for the JACEE High Altitude Long
Duration Balloon Flight. For presentation at the
30th COSPAR Scientific Assembly, Hamburg,
Germany, July 11–21, 1994.

SPRINGER, A.M.
Project Adam: The Army’s Man in Space Program. For publication in Quest Magazine, Grand Rapids, MI.

SPRINGER, A.M.
Experimental Determination of the Discharge
Coefficients for the Advanced Solid Rocket
Motor (ASRM) Ignitor Discharge Ports. For presentation at the AIAA Space Programs and
Technologies Conference, Huntsville, AL,

SPRINGER, A.M.
Experimental Investigation of Plume Induced
Flow Separation for the National Launch System
(NLS) 1½ Stage Launch Vehicle. For presentation
at the 32nd Aerospace Sciences Meeting,

SPRINGER, A.M.
The George C. Marshall Space Flight Center’s
14x14-Inch Trisonic Wind Tunnel: A Historical
Perspective. For presentation at the 32nd
Aerospace Sciences Meeting, Reno, NV,

SPRINGER, A.M.
POKORA, D.C.
Ascent Flight Aerodynamic Characteristics of
the National Launch System (NLS) 1½ Stage
Launch Vehicle: NLS-2. For presentation at the
32nd Aerospace Sciences Meeting, Reno, NV,

SRINIVAS, R.
(Teledyne Brown)
HAMBRIGHT, G.
AINSWORTH, M.
FISKE, M.
SCHAFFER, D.
Crystal Growth Furnace System Configuration
and Planned Experiments on the Second United
States Microgravity Laboratory Mission. For
presentation at the AIAA 32nd Aerospace
Sciences Meeting, Reno, NV, January 10–13,
1994.

SRINIVASAN, R.
HE, K.
PENN, B.
FRAZIER, D.O.
ET AL.
Nonlinear Optical Properties and Determination
of Monolayer Molecular Orientation of
Langmuir-Blodgett Films Using Second Har
monic Generation. For presentation at the 1993
OSA, Toronto, Canada, October 3–8, 1993.

STOKES, E.H.
(SRI)
UPTON, C.G.
Selection of Improved Acceptance Tests for
Cured Carbon Phenolic Composites, Phase II.
For presentation at JANNAF, Redstone Arsenal,
AL, October 19–21, 1993.

STOLLBERG, M.T.
FINGER, M.H.
WILSON, R.B.
HARMON, B.A.

The information in this report has been reviewed for technical content. Review of any information concerning Department of Defense or nuclear energy activities or programs has been made by the MSFC Security Classification Officer. This report, in its entirety, has been determined to be unclassified.

C.D. BEAN
Director
Human Resources and Administrative Support Office
**Title:** FY 1994 Scientific and Technical Reports, Articles, Papers, and Presentations

**Author:** Compiled by Joyce E. Turner

**Performing Organization:**
George C. Marshall Space Flight Center
Marshall Space Flight Center, Alabama 35812

**Sponsoring/Monitoring Agency:**
National Aeronautics and Space Administration
Washington, DC 20546

**Abstract:**
This document presents formal NASA technical reports, papers published in technical journals, and presentations by MSFC personnel in FY94. It also includes papers of MSFC contractors.

After being announced in STAR, all of the NASA series reports may be obtained from the National Technical Information Service, 5285 Port Royal Road, Springfield, VA 22161.

The information in this report may be of value to the scientific and engineering community in determining what information has been published and what is available.
