Blade lean is used to improve the uniformity of exit flow distributions from turbomachinery blading. In turbines, it has been used to control secondary flows by tailoring blade turning to reduce flow overturning and underturning and to create more uniform loss distributions from hub to shroud.

In the present study, the Pump Consortium centrifugal impeller has been redesigned using blade lean. The flow at the exit of the baseline impeller had large blade-to-blade variations, creating a highly unsteady flow for the downstream diffuser. Blade lean is used to redesign the flow to move the high loss fluid from the suction side to the hub, significantly reducing blade-to-blade variations at the exit.

Controlling Exit Loss Distributions

PRECEDING PAGE BLANK NOT FILMED
Linear Cascade

No Lean

Static pressure contours established by primary flow.

Blade Lean

Boundary layer flow towards top endwall/suction side corner region.

Compound Lean

Boundary layer accumulation towards midspan.

Annular Cascade

No Lean

Expect more losses in hub/suction side corner region.

Tangential Lean

Opposing radially inward flow in suction side boundary layer.

Compound Lean

Spreading loss spanwise.

Equations for Incompressible Flow in a Rotating System

Reduced static pressure

\[ p_r = p - \frac{1}{2} \rho \omega^2 r^2. \]

Rotary stagnation pressure

\[ p^* = p + \frac{1}{2} \rho \omega^2 - \frac{1}{2} \rho \omega^2 r^2 \]

Absolute vorticity

\[ \Omega = \nabla \times \mathbf{V} = \nabla \times \mathbf{W} + 2\mathbf{\omega} \]

Momentum, inviscid flow

\[ (\mathbf{W} \cdot \nabla)\mathbf{W} + 2\mathbf{\omega} \times \mathbf{W} = -\frac{1}{\rho} \nabla p_r \]
Determining the Stable Orientation Vector for Secondary Vorticity Suppression in Rotating Systems

Secondary Circulation, Hawthorne

\[
\frac{\partial}{\partial s} \left( \frac{\Omega_s}{W} \right) = \frac{2}{\rho W^2} \left( \frac{1}{R_n} \frac{\partial p^*}{\partial b} + \omega \frac{\partial p^*}{\partial z} \right)
\]

From momentum

\[
W \times \Omega = \frac{1}{\rho} \nabla p^*
\]

or

\[
W \cdot \nabla p^* = 0, \quad \nabla p^* \perp W
\]

Generation of secondary circulation \(= 0\) when

\[
W \cdot \left[ -\frac{1}{\rho} \nabla p_r - \omega \times W \right] \times \nabla p^* = 0
\]

i.e. the component of the vector

\[
-\frac{1}{\rho} \nabla p_r - \omega \times W
\]

perpendicular to the relative velocity points to the stable location of high loss fluid.
