ABSTRACT

The effect of Nb$_2$O$_5$ and V$_2$O$_5$ addition on the superconducting properties and microstructure of YBa$_2$Cu$_3$O$_y$ has been studied in thin films. Polycrystalline targets for laser ablation were prepared by mixing high purity V$_2$O$_5$ or Nb$_2$O$_5$ powders with a well characterized YBa$_2$Cu$_3$O$_y$ powder in the range 0 to 4 wt% by solid state reaction method. Thin films (~1500 A thickness) of the above targets were grown on <100> SrTiO$_3$ (STO) and <100> LaAlO$_3$ (LAO) substrates at 700°C temperature by Pulsed Laser Deposition (PLD) technique. In the case of Nb$_2$O$_5$ addition we have noticed an increase in J$_c$ up to 0.5 wt% and higher additive concentration (greater than 0.5 wt%) have degraded the superconducting properties. However, in the case of V$_2$O$_5$ addition, there is an improvement in current density and microstructural properties up to 1 wt% and the superconducting properties degrade for concentrations greater than 1 wt%. The best J$_c$ for 0.5 wt% of Nb$_2$O$_5$ added YBCO thin film is 1.6x10$^6$ A/cm$^2$ and for that of V$_2$O$_5$ added sample is 3.4x10$^6$ A/cm$^2$ at 77K as compared to the pure YBa$_2$Cu$_3$O$_y$ (YBCO) film J$_c$ (1.2x10$^6$ A/cm$^2$) observed on STO substrates. The reason for improvement in J$_c$ and microstructural properties in the case of V$_2$O$_5$ addition could be due to the low melting of V$_2$O$_5$ (690°C) which can act as a very good surfactant during deposition. Over all, we have realized that Nb$_2$O$_5$ addition or V$_2$O$_5$ addition to YBCO have shown significant improvement over the undoped YBa$_2$Cu$_3$O$_{7-x}$ films grown under identical conditions
1. INTRODUCTION

Research in high temperature superconductivity (HTSC) has made significant progress towards improving the microstructural and crystallographic quality of thin films during the last four years [1-3]. Effect of addition or substitution of transition metal elements in YBCO compound has been investigated and it is well established that superconducting properties will be suppressed by substitution at the Copper site by elements like Al, Ag, V, Nb, Ta and more severely suppressed by the substitution of Fe, Co, Ni & Zn [4,5,9]. Also, addition of transition metal elements to YBCO has resulted in similar effects above a certain concentration of additive [6]. Evidences confirm that Nb$_2$O$_5$ addition upto 0.5% has resulted in improvement of mechanical, microstructural and superconducting properties of YBCO compound in bulk form [7-8]. It has been stated that Silver plays an important role in improving the microstructural and transport properties [10-11] due to dissociation of Ag$_2$O on the substrate and the increased mobility of Ag atoms segregating out of the YBCO grains is responsible for the enlargement and alignment of grains in Ag-doped YBCO films. This result has motivated us to study the doping of some oxides which can melt on the substrate at low temperatures to aid the grain growth. In the present study we report the addition effect of V$_2$O$_5$ and Nb$_2$O$_5$ to YBCO on its superconducting properties.

2. EXPERIMENTAL

Targets for the Laser deposition were prepared by mixing 3N pure V$_2$O$_5$ and Nb$_2$O$_5$ powders with a well characterized YBa$_2$Cu$_3$O$_y$ (YBCO, 99.99% pure) in the concentration range of 0.0 to 4 wt% by solid state reaction method. Thin films of above samples were made using an excimer laser (Lambda Physik 301:KrF, 248 nm and 300mm focal length quartz lens for laser beam focussing) [12]. The substrate to target distance was 4.5cm and growth pressure was
200 mTorr oxygen at 700°C substrate temperature and films were deposited in the thickness range 1500-2000 Angstroms. Structural characterization was done using JEOL 8030 XRD powder diffractometer and surface morphology of the films were studied by JEOL 840 scanning electron microscopy (SEM). DC electrical resistivity was measured by using standard linear four probe technique. Critical current density measurements were carried out using laser patterned 40-20 µm wide and 1mm long microbridges. The standard voltage criterion of 1µV/mm was used for determining $J_c$.

3. RESULTS AND DISCUSSION

a) $V_2O_5$ DOPED YBCO THIN FILMS:

XRD data has shown c-axis oriented films for 0.5 to 1 wt% $V_2O_5$ added YBCO thin films. An addition 4 wt% of $V_2O_5$ has yielded poor quality superconducting thin films (fig. 3) compared to undoped YBCO thin film. Undoped YBCO thin film made under identical conditions has relatively lower $T_c(\approx 89K)$ and $J_c(\approx 1.2\times10^6 A/cm^2$ at 77K ) values. The best results for $V_2O_5$ doped YBCO thin films were observed for 0.5 wt% addition ( $T_{c,0} \approx 89.5K$ and $J_c \approx 3.6\times10^6 A/cm^2$ at 77K). Such high $J_c$ values in the case of undoped YBCO thin films could be realized, only at higher deposition temperatures (800°C) on STO<100> substrate [9]. The $V_2O_5$ doped YBCO thin films deposited on LAO substrate have yielded relatively inferior quality superconducting films when compared to that deposited on SiTiO$_3$ <100> substrate. The reason for this could be a good lattice match of SiTiO$_3$ with YBCO. We couldn't get any information from scanning electron micrographs as they are featureless which may be due to perfect orientation of grains. It is evident from fig. 3, the slope of the $T_c$-$T$ vs $\sqrt{J_c}$ plot of $V_2O_5$ doped films is larger compared to that of undoped YBCO film, indicating grain enlargement and reduction of weak links.

b) $Nb_2O_5$ DOPED YBCO THIN FILMS:

Our results show that $Nb_2O_5$ addition upto 0.5 wt% in
bulk has improved the superconducting properties of YBCO compound, however, no substantial improvement in the case of thin films deposited even on SrTiO\textsubscript{3} \langle 100 \rangle substrates has been noticed. X-ray diffraction patterns have showed (fig. 1) that films are c- axis oriented YBCO along with growth of \langle \text{hoo} \rangle oriented a secondary phase YBa\textsubscript{2}NbO\textsubscript{6}, with the increase of Nb\textsubscript{2}O\textsubscript{5} \geq 1 wt\%. However, the T\textsubscript{c} \approx 89.1 and J\textsubscript{c} = 1.6 \times 10^6 \textascm\textsuperscript{-2} for Nb = 0.5 wt\% doped YBCO thin films have been recorded, degradation of superconducting properties has been noticed with increase in Nb\textsubscript{2}O\textsubscript{5} concentration ( \geq 1 wt\%). The slope of T\textsubscript{c} - T vs \sqrt{J\textsubscript{c}} plot is slightly larger than the undoped YBCO film but smaller than V\textsubscript{2}O\textsubscript{5} doped YBCO thin film which indicates that the grain size has not substantially improved when compared with that of V\textsubscript{2}O\textsubscript{5} added film.

c) POSSIBLE EXPLANATION :

From the above results it is clear that V\textsubscript{2}O\textsubscript{5} addition has improved the quality of YBCO superconducting thin films compared to that of Nb\textsubscript{2}O\textsubscript{5} added YBCO thin films on SrTiO\textsubscript{3} substrate. Films deposited on LaAlO\textsubscript{3} substrates have resulted in poor quality due to the lattice mismatch between substrate and film. However, there is an improvement in J\textsubscript{c} of 0.5 wt \% V\textsubscript{2}O\textsubscript{5} added film compared to that of Nb\textsubscript{2}O\textsubscript{5} added and undoped YBCO film. Due to its low melting point, V\textsubscript{2}O\textsubscript{5} during growth process may act as a surfactant and aids in better coalition of the individual grain which leads to increase in grain size of YBCO, where as in the case of Nb\textsubscript{2}O\textsubscript{5} addition since the melting point is very high such a process does not take place. This is clearly evidenced in the improvement in J\textsubscript{c} in the former case. De Gennes [13] and Clarke [14] have predicted a mechanism that near T\textsubscript{c} the critical current density of S-N-S junctions can be expressed as

\[ J\textsubscript{c}(T) \propto (T\textsubscript{c} - T)^2 \exp \left( -\frac{d}{\xi_n} \right) \]

Where d is the thickness of the the grain boundary layer and \xi_n is the coherence length. From this equation the nature of grain boundaries in doped and undoped YBCO thin films can be studied by plotting T\textsubscript{c} - T vs \sqrt{J\textsubscript{c}} and the slope of this plot will
decide the grain boundary domain thickness which in turn reflects on the nature of weak links. We have plotted $T_C - T$ vs $\sqrt{J_C}$ values upto 77K for the sake of comparison in the cases of 0.5 wt% added V$_2$O$_5$ and Nb$_2$O$_5$ and undoped YBCO film. From fig. 2, it is evident that V$_2$O$_5$ addition yields a larger slope value compared to Nb$_2$O$_5$ doped and undoped YBCO thin films, which is indicative of improvement in grain structure.

CONCLUSIONS

The effect of V$_2$O$_5$ and Nb$_2$O$_5$ addition on the superconducting properties of YBCO thin films is studied. It has been realized that V$_2$O$_5$ can act as a very good surfactant than Nb$_2$O$_5$ because of its low melting point. Also, it is found that there is an improvement in the $J_C$ of the 0.5 wt% V$_2$O$_5$ doped YBCO thin film compared to that of Nb$_2$O$_5$ (0.5 wt%) doped and undoped YBCO thin films. This could be due to the surfactant effect of V$_2$O$_5$ which melts at relatively low temperature and improves the grain structure. On the other hand, the addition of Nb$_2$O$_5$ (which has high melting point) does not show such improvement.
