October 1996
FOREWORD

In accordance with the NASA Space Act of 1958, the MSFC has provided for the widest practicable and appropriate dissemination of information concerning its activities and the results thereof.

Since July 1, 1960, when the George C. Marshall Space Flight Center was organized, the reporting of scientific and engineering information has been considered a prime responsibility of the Center. Our credo has been that "research and development work is valuable, but only if its results can be communicated and made understandable to others."

The N number shown for the reports listed is assigned by the Center for AeroSpace Information (CASI), Baltimore, MD, indicating that the material is unclassified and unlimited and is available for public use. These publications can be purchased from the National Technical Information Service, 5285 Port Royal Road, Springfield, VA 22161. The N number should be cited when ordering.

The second United States Microgravity Payload (USMP–2), flown in March 1994, carried four major microgravity experiments plus a sophisticated accelerometer system. The USMP program is designed to accommodate experiments requiring extensive resources short of a full Spacelab mission. The four USMP–2 experiments dealt with understanding fundamental aspects of materials behavior, three with the formation of crystals from melts, and one with the critical point of a noble gas. This successful, scientifically rich mission also demonstrated telesience operations.

This report documents the Marshall Space Flight Center (MSFC) 13-month smoothed solar flux ($F_{10,7}$) and geomagnetic index ($A_p$) intermediate (months) and long-range (years) statistical estimation technique, referred to as the MSFC Lagrangian Linear Regression Technique (MLLRT). Estimates of future solar activity are needed as updated input to upper atmosphere density models used for satellite and spacecraft orbital lifetime predictions. An assessment of the MLLRT computer program's products is provided for 5-year periods from the date estimates were made. This was accomplished for a number of past solar cycles.

A space flight qualified controller for experiments that is modular and based on an open architecture commercially available standard can reduce system development time by leveraging off commercial hardware and software. While the unique requirements of flight may mandate custom hardware designs, a modular design approach in which a core set of modules is designed and built would provide a basis for future experiment controllers. Any unique requirements could then be met by adding modules as necessary. A central processing unit module, a MIL–STD–1553 interface module, and a Spacelab interface module were developed. These modules are linked using the IEEE standard 1296 Multibus II™ bus architecture. This report describes the work done to develop this core set of processing and interface modules that meet the IEEE 1296 Multibus II™ standards.
Zerodur™ is a low coefficient of thermal expansion glass-ceramic material. This property makes Zerodur™ an excellent material for high precision optical substrates. Functioning as a high precision optical substrate, a material must be dimensionally stable in the system operating environment. Published data indicate that Zerodur™ is dimensionally unstable when exposed to large doses of ionizing radiation. The dimensional instability is discussed as an increase in Zerodur™ density. This increase in density is described as a compaction.

Experimental data showing proton-induced compaction of Zerodur™ is presented. The dependence of compaction on proton dose was determined to be a power law relationship. Previous publications determined a powder law relationship between Zerodur™ compaction and electron radiation. Correlation between the published data and the results of this investigation are currently being studied.

To obtain the proper measurement amplitude with a spectrum analyzer, the correct frequency-dependent transducer factor must be added to the voltage measured by the transducer. This report will examine how entering transducer factors into a spectrum analyzer can cause significant errors in field amplitude due to the misunderstanding of the analyzer’s interpolation methods. It will also discuss how to reduce these errors to obtain a more accurate field amplitude reading.

The space station furnace facility (SSFF) provides the necessary core systems to operate various material processing furnaces. The thermal control system (TCS) is defined as one of the core systems, and its function is to collect excess heat from furnaces and to provide precise cold temperature control of components and of certain furnace zones. Physical interconnection of parallel thermal control subsystems through a common pump implies the description of the whole TCS by coupled nonlinear differential equations in flow and pressure. The report formulates the system equations and develops the sliding mode controllers that cause the interconnected subsystems to operate in the local sliding modes, resulting in control system invariance to interaction disturbances and plant uncertainties. The desired decoupled flow rate profile tracking is achieved by optimization of the local linear sliding mode equations. Extensive digital simulation results are presented to show the flow rate tracking robustness and invariance to plant nonlinearities, time-varying plant parameters, and variations of the system pressure supplied to the controlled subsystems. A comparison against the popular proportional-plus-derivative-plus-integral (PID) control algorithm is included to demonstrate improved performance over traditional control techniques.

This report is a summary of work accomplished under Technical Task Agreement by the Marshall Space Flight Center (MSFC) and documents activities regarding the Environmental Control and Life Support Systems (ECLSS) of the International Space Station (ISS) program. These MSFC activities were in-line to the designing, the development, the testing, and the flight of ECLSS equipment. MSFC’s unique capabilities for performing integrated system testing and analyses, and its ability to perform some tasks cheaper and faster to support ISS program needs are the basis for the Technical Task Agreement activities. Tasks were completed in the water recovery systems, air revitalization systems, and microbiology areas. The results of each task are described in this summary report.
model for various parameters of the Mars atmosphere. Detailed descriptions are given of the main driver programs, subroutines, and associated computational methods. Lists and descriptions include input, output, and local variables in the programs. These descriptions give a summary of program steps and "map" of calling relationships among the subroutines. Definitions are provided for the variables passed between subroutines through "common" lists. Explanations are provided for all diagnostic and progress messages generated during execution of the program. A brief outline of future plans for Mars-GRAM is also presented.

TM–108510 June 1996

19960027992N (96N–29111)

A unique growth cell was designed in which crossed electric and magnetic fields could be separately or simultaneously applied during semiconductor crystal growth. A thermocouple was inserted into an InSb melt inside the growth cell to examine the temperature response of the fluid to applied electromagnetic fields. A static magnetic field suppressed time-dependent convection when a destabilizing thermal field was applied. The simultaneous application of electric and magnetic fields resulted in forced convection in the melt. The InSb ingots grown in the cell were polycrystalline. An InGaSb crystal, 0.5 cm in diameter and 23-cm long, was grown without electromagnetic fields applied. The axial composition results indicated that complete mixing in the melt occurred for this large aspect ratio.

TM–108511 June 1996

19960047082N (96N–29111)

The terrestrial environment is an important forcing function in the design and development of the launch vehicle. The scope of the terrestrial environment includes the following phenomena: Winds; atmospheric thermodynamic models and properties; thermal radiation; U.S. and world surface environment extremes; humidity; precipitation, fog, and icing; cloud characteristics and cloud cover models; atmospheric electricity; atmospheric constituents; vehicle engine exhaust and toxic chemical release; occurrences of tornados and hurricanes; geological hazards, and sea states. One must remember that the flight profile of any launch vehicle is in the terrestrial environment. Terrestrial environment definitions are usually limited to information below 90 km. Thus, a launch vehicle’s operations will always be influenced to some degree by the terrestrial environment with which it interacts. As a result, the definition of the terrestrial environment and its interpretation is one of the key launch vehicle design and development inputs. This definition is a significant role, for example, in the areas of structures, control systems, trajectory shaping (performance), aerodynamic heating, and take off/landing capabilities. The launch vehicle’s capabilities which result from the design, in turn, determines the constraints and flight opportunities for tests and operations.

TM–108512 June 1996

19960027985N (96N–29104)

More extensive testing was performed through a NASA research announcement (NRA) between Marshall Space Flight Center (MSFC) and Lockheed Martin Astronautics on the promising LO2 propellant conditioning concept of passive recirculation (no-bleed). Data from the project are being used to further anchor models in LO2 conditioning behavior and broaden the data base of no-bleed and low-bleed conditioning. Data base expansion includes results from testing the limits of no-bleed and low-bleed conditioning with various configuration changes to the test facility and designed test article. Configuration changes include low velocity effects in the recirculation loop above the test article, test article internal constriction impacts, test article out-of-plane effects, impact from an actual Titan LO2 pump attachment, feed duct slope effects, and up-leg booster effects. LN2 was used as the test fluid. The testing was conducted between July 1994 and January 1995 at the west test area of MSFC. Data have shown that in most cases passive recirculation was demonstrated when the aforementioned limits were applied.

TM–108513 July 1996

19960042695N (96N–31648)
This report describes the newly revised model thermosphere for the Mars Global Reference Atmospheric Model (Mars-GRAM, Version 3.4). It also provides descriptions of other changes made to the program since publication of the programmer’s guide (Justus et al., 1996) for Mars-GRAM Version 3.34. The original Mars-GRAM model thermosphere was based on the global-mean model of Stewart (1987). The revised thermosphere is based largely on parameterizations derived from output data from the three-dimensional Mars Thermospheric Global Circulation Model (MTGCM) of Bougher et al. (1990). The new thermospheric model includes revised dependence on the 10.7-cm solar flux for the global means of exospheric temperature, temperature of the base of the thermosphere, and scale height for the thermospheric temperature variations, as well as revised dependence on orbital position for global mean height of the base of the thermosphere. Other features of the new thermospheric model are (1) realistic variations of temperature and density with latitude and time of day; (2) more realistic wind magnitudes, based on improved estimates of horizontal pressure gradients; and (3) allowance for user-input adjustments to the model values for mean exospheric temperature and for height and temperature at the base of the thermosphere. Other new features of Mars-GRAM 3.4 include (1) allowance for user-input values of climatic adjustment factors for temperature profiles from the surface to 75 km, and (2) a revised method for computing the sub-solar longitude position in the "ORBIT" subroutine.

TM–108514 June 1996

19960044383N (96N–31927)

The Computer-Aided System Engineering and Analysis (CASE/A) Version 5.0 User’s Manual provides the user with information needed to execute and learn the CASE/A 5.0 modeling package. CASE/A 5.0 is a trade study tool that provides modeling/simulation capabilities for analyzing environmental control and life support systems and active thermal control systems. CASE/A has been successfully used in studies such as the evaluation of carbon dioxide removal in the Space Station Freedom.

CASE/A modeling provides a graphical and command-driven interface for the user. This interface allows the user to construct a model by placing equipment components in a graphical layout of the system hardware, then connect the components via flow streams and define their operating parameters. Once the equipment is placed, the simulation time and other control parameters can be set to run the simulation based on the model constructed. After completion of the simulation, graphical plots or text files can be obtained for evaluation of the simulation results over time. Additionally, users have the capability to control the simulation and extract information at various times in the simulation (e.g., control equipment operating parameters over the simulation time or extract plot data) by using "User Operations (OPS) Code." This OPS code is written in FORTRAN with a canned set of utility subroutines for performing common tasks.

CASE/A version 5.0 software runs under the VAX VMS™ environment. It utilizes the Tektronics 4014™ graphics display system and the VT100™ text manipulation/display system.

TM–108515 June 1996
Enhancement of High-Speed Infrared Array Electronics (Center Director’s Discretionary Fund Final Report, Project 93–03). W.T. Sutherland. Astronics Laboratory.

A state-of-the-art infrared detector was to be used as the sensor in a new spectrometer-camera for astronomical observations. The sensitivity of the detector required the use of low-noise, high-speed electronics in the system design. The key component in the electronic system was the pre-amplifier that amplified the low voltage signal coming from the detector. The system was designed based on the selection of the amplifier and that was driven by the maximum noise level, which would yield the desired sensitivity for the telescope system.

TM–108516 September 1996

A vacuum chamber designed for use in shearography nondestructive evaluation of aerospace components is presented. The inspection of an aerospace insulation is used as an example of vacuum excitation shearography for evaluation of debonds. Design drawings of subcomponents and the assembly are included in an appendix.

TM–108517 September 1996

The Computer Aided System Engineering and Analysis (CASE/A) Version 5.0 Programmer’s Manual provides the programmer and user with information regarding the internal structure of the CASE/A 5.0 software system. CASE/A 5.0 is a trade study tool that provides modeling/simulation
capabilities for analyzing environmental control and life support systems and active thermal control systems. CASE/A has been successfully used in studies such as the evaluation of carbon dioxide removal in the space station.

CASE/A modeling provides a graphical and command-driven interface for the user. This interface allows the user to construct a model by placing equipment components in a graphical layout of the system hardware, then connect the components via flow streams and define their operating parameters. Once the equipment is placed, the simulation time and other control parameters can be set to run the simulation based on the model constructed. After completion of the simulation, graphical plots or text files can be obtained for evaluation of the simulation results over time. Additionally, users have the capability to control the simulation and extract information at various times in the simulation (e.g., control equipment operating parameters over the simulation time or extract plot data) by using “User Operations (OPS) Code.” This OPS code is written in FORTRAN with a canned set of utility subroutines for performing common tasks.

CASE/A version 5.0 software runs under the VAX VMS™ environment. It utilizes the Tektronics 4014™ graphics display system and the VT100™ text manipulation/display system.
Localized corrosion in welded samples of 2219–T87 Al alloy (2319 filler), 2090 Al-Li alloy (4043 and 2319 fillers), and 2195 Al-Li alloy (4043 and 2319 fillers) has been investigated using the relatively new scanning reference electrode technique. The weld beads are cathodic in all cases, leading to reduced anode/cathode ratios. A reduction in anode/cathode ratio leaders to an increase in the corrosion rates of the welded metals, in agreement with results obtained in previous electrochemical and stress corrosion studies involving the overall corrosion rates of welded samples. The cathodic weld beads are bordered on both sides by strong anodic regions, with high propensity for corrosion.

The dynamic environment must be known to evaluate high pressure oxidizer turbopump inducer fatigue life. This report sets the dynamic design loads for the alternate turbopump inducer as determined by water-flow rig testing. Also, guidelines are given for estimating the dynamic environment or other inducer and impeller applications.

Numerous thermal control and polymeric samples with potential International Space Station applications were evaluated for atomic oxygen and vacuum ultraviolet radiation effects in the Princeton Plasma Physics Laboratory 5-eV Neutral Atomic Oxygen Facility and in the MSFC Atomic Oxygen Drift Tube System. Included in this study were samples of various anodized aluminum samples, ceramic paints, polymeric materials, and beta cloth, a Teflon™-impregnated fiberglass cloth. Aluminum anodizations were black duranodic, chromic acid anodize, and sulfuric acid anodize. Paint samples consisted of an inorganic glossy black paint and Z–93 white paint made with the original PS7 binder and the new K2130 binder. Polymeric samples evaluated included bulk Halar™, bulk PEEK, and silverized FEP Teflon™. Aluminized and nonaluminized Chemfab 250™ beta cloth were also exposed. Samples were evaluated for changes in mass, thickness, solar absorptance, and infrared emittance. In addition to material effects, an investigation was made comparing diffuse reflectance/solar absorptance measurements made using a Beckman DK2 spectroreflectometer and like measurements made using an AZ Technology-developed laboratory portable spectroreflectometer.

Marshall Space Flight Center has a rich heritage of launch vehicles that have used aerodynamic surfaces for flight stability and for flight control. Recently, due to the aft center-of-gravity (cg) locations on launch vehicles currently being studied, the need has arisen for the vehicle control augmentation that can be provided by these flight controls. Aerodynamic flight control can also reduce engine gimbaling requirements, provide actuator failure protection, enhance crew safety, and increase vehicle reliability and payload capability.

As a starting point for the novel design of aerodynamic flight control augmentors for a Saturn class, aft cg launch vehicle, this report undertakes a review of our national heritage of launch vehicles using aerodynamic surfaces, along with a survey of current use of aerodynamic surfaces on large launch vehicles of other nations. This report presents one facet of Center Director’s Discretionary Fund Project 93–05 and has a previous and subsequent companion publication.

While the systems engineering process is a program formal management technique and contractually binding, the design process is the informal practice of achieving the design project requirements throughout all design phases of the systems engineering process. The design process and organization are systems- and component-dependent. Informal reviews include technical information meetings and concurrent engineering sessions, and formal technical discipline reviews are conducted.
The characteristics of the minima between sunspot cycles are found to provide important information for predicting the amplitude and timing of the following cycle. For example, the time of the occurrence of sunspot minimum sets the length of the previous cycle, which is correlated by the amplitude-period effect to the amplitude of the next cycle, with cycles of shorter (longer) than average length usually being followed by cycles of larger (smaller) than average size (true for 16 of 21 sunspot cycles). Likewise, the size of the minimum at cycle onset is correlated with the size of the cycle's maximum amplitude, with cycles of larger (smaller) than average size minima usually being associated with larger (smaller) than average size maxima (true for 16 of 22 sunspot cycles). Also, it was found that the size of the previous cycle's minimum and maximum relates to the size of the following cycle's minimum and maximum with an even-odd cycle number dependency. The latter effect suggests that cycle 23 will have a minimum and maximum amplitude probably larger than average in size (in particular, minimum smoothed sunspot number Rm = 12.3±7.5 and maximum smoothed sunspot number Rm = 198.8±36.5, at the 95-percent level of confidence), further suggesting (by the Waldmeier effect) that it will have a faster than average rise to maximum amplitude. Using cycle 22 as a test case, we show that by the 12th month following conventional onset, cycle 22 appeared highly likely to be fast-rising, larger-than-average-size cycle. Because of the inferred correlation between ascent duration and period, it also seems likely that it will have a period shorter than average length.

TP–3653

September 1996

The positive aspect of problem occurrences is the opportunity for learning and a challenge for innovation. The learning aspect is not restricted to the solution period of the problem occurrence, but can become the beacon for problem prevention on future programs. Problems/failures serve as a point of departure for scaling to new designs. To ensure that problems/failures and their solutions guide the future programs, a concerted effort has been expended to study these problems, their solutions, their derived lessons learned, and projections for future programs. This includes identification of technology thrusts, process changes, codes development, etc. However, they must not become an excuse for adding layers upon layers of standards, criteria, and requirements, but must serve as guidelines that assist instead of stifling engineers. This report is an extension of prior efforts to accomplish this task. Although these efforts only scratch the surface, it is a beginning that others must complete.

MSFC PAPERS CLEARED FOR PRESENTATION
(Available only from authors. Dates are presentation dates.)

HUNG, R.J. ES71 (UAH)
PAN, H.L. ES71 (UAH)
Effect of Baffles on Orbital Accelerations—
Induced Bubble Oscillations in Microgravity.
For publication in International Journal of
Mechanical Science, 1996.

HUNG, R.J. ES71 (UAH)
PAN, H.L. ES71 (UAH)
Baffle Effect Modulated Interface Oscillations
Activated by Gravity Gradient Dominated
Accelerations in Microgravity. For publication in
Microgravity Quarterly, 1996.

HUNG, R.J. ES71 (UAH)
PAN, H.L. ES71 (UAH)
Effect of Baffles on Sloshing Modulated Forces
and Torques Disturbances Reacted to Gravity
Gradient Dominated Accelerations. For publica-
tion in Transactions of the Canadian Society for
Mechanical Engineering, 1996.

HUNG, R.J. ES41 (UAH)
ZU, G.J. UAH
LONG, Y.T. UAH
Coupling of Gravity-Gradient-Dominated Accele-
ration-Induced Slosh Reaction Torques With
Spacecraft Orbital Dynamics. For publication in

HUTT, J.J. EP12
CRAMER, J.M. EP12
Advanced Rocket Injector Development at the
Marshall Space Flight Center. For presentation at
AIAA Space Programs and Technology Confer-
ence, Huntsville, AL, September 24–26, 1996.

IRION, F.W. California Institute of Technology
MOYER, E.J. California Institute of Technology

Stratospheric Observations of CH3D and HDO
From ATMOS Infrared Solar Spectra: Enrich-
ments of Deuterium in Methane and Implica-
tions for HD. For publication in American Geo-
physical Union, Washington, DC, 1996.

JACKSON, M.E. ED12
SHTESSEL, Y.B. UAH
Sliding Mode Thermal Control System for Space
Station Furnace Facility. For publication in IEEE
Transactions on Control Systems Technology,

JARZEMBSKI, M.A. ES41
SRIVASTAVA, V. ES41
CHAMBERS, D.M. Micro Craft, Inc.
Lidar Calibration Technique Using Lab-
Generated Aerosols. For publication in Applied

JEDLOVEC, G.J. ES41
ATKINSON, R.J. Lockheed Martin
LERNER, J.A. UAH
Upper-Level Water Vapor Transport From
GOES Data. For presentation at Conference on
Hydrology, 77th AMS Annual Meeting, Long

JEDLOVEC, G.J. ES41
ATKINSON, R.J. Lockheed Martin
KIDDER, S.Q. Colorado State University
A Water Vapor Transport Index for Climate
Research. For presentation at Second GEWEX

JENKINS, F.M. Auburn University
CRUIT, W. EP12
SMITH, A. EP12
Cold-Flow Study of Hybrid Rocket Motor Flow
Dynamics. For presentation at 32nd Annual
Joint Propulsion Conference, Orlando, FL, July
1996.

JOHNSON, D.L. EL23
PEARSON, S.D.
Tornadic Weather Consideration for Various
NASA Sites/Projects. For presentation at AIAA

JOHNSON, L. PS02
ESTES, R. Smithsonian
LORENZINI, E. Smithsonian
CARROLL, J. Tether Appl. Comp.
GILCHRIST, B. University of Michigan
Electrodynamic Tethers for Spacecraft Propul-
sion and Reboost of the International Space
Station. For presentation at AIAA Space Programs
and Technology Conference, Huntsville, AL,
September 24–26, 1996.

RESKE, E. ED32
MCDANIELS, D. ED32
GOROKOV, V. Chemical Automatics

NADARAJAH, A. UAH
PUSEY, M.L. ES76

Growth Mechanism and Morphology of Tetragonal Lysozyme Crystals. For publication in Journal of Acta Crystallographica Section D.

NEERGAARD, L.F. UAH
MUSIELAK, Z.E. UAH
HATHAWAY, D.H. ES82

Klein-Gordon Equations for Acoustic Waves and Their Applications in Helioseismology. For publication in Solar Physics, Dordrecht/Boston/London.
Neural Net to Predict Silica Aerogel Transparency. For publication in Physical Review A, Ridge, NY.

NOEVER, D.A. ES76
Computerized Monitoring of Aqueous Heavy Metal and Organic Chemical Contamination Based on Protozoa Swimming Response. For presentation at The Second International Conference on Environment and Industrial Toxicology, Bangkok, Thailand, December 9–13, 1996.

NOEVER, D.A. ES76
BRITTAIN, A. NRC/ES76
MATSOS, H.C. ES76
BASKARAN, S. Hughes
OBENHUBER, D. MCI
The Effects of Variable Biome Distribution on Global Climate. For presentation at The Seventh Annual Global Warming International Conference and Expo, Vienna, Austria, April 1–3, 1996.

NOEVER, D.A. ES76
CRONISE, R.J. ES76
MATSOS, H.C. ES76
Optimized Group Contribution Methods for Predicting Chemical Biodegradation and Eye Irritancy. For publication in Toxicological and Environmental Chemistry, Bayrenth, Germany.

NOEVER, D.A. ES76
MATSOS, H.C. ES76
CRONISE, R.J. ES76
LOOGER, L.L. ES76
RELWANI, R.A. ES76
JOHNSON, J.U. Alabama A&M University
Computerized In Vitro Test for Chemical Toxicity Based on Tetrahymena Swimming Patterns. For presentation at The Second International Conference on Environmental and Industrial Toxicology, Bangkok, Thailand, December 9–13, 1996.

NOLEN, A.M. EH12
ROBINSON, J.H. ED52
Aluminum Foam as Orbital Debris Shielding. For presentation at AIAA Space Programs and Technologies Conference, Huntsville, AL, September 24–26, 1996.

NONEMAN, S.R. EO02
NAHAY, E. Teledyne Brown

NONEMAN, S.R. EO02

NOVAK, H.L. USBI
HALL, P.B. EH14
Development of Environmentally Compatible Solid Film Lubricants. For presentation at Second Aerospace Technology Conference, Huntsville, AL, August 6–8, 1996.

NURRE, G.S. ED12
WHORTON, M.S. ED12
KIM, Y. ED12
EDBERG, D. McDonnell Douglas
BOUCHER, R. McDonnell Douglas
SCHENCK, D.
Results of the STABLE Microgravity Vibration Isolation Flight Experiment. For presentation at 67th Shock and Vibration Symposium, Monterey, CA, November 18–22, 1996.

NURRE, G.S. ED12
WHORTON, M.S. ED12
KIM, Y. ED12
EDBERG, D. McDonnell Douglas
SCHENCK, D.
Oxidation Generation Technology Tests at MSFC. For presentation at 26th International Conference on Environmental Systems, Monterey, CA, July 8–11, 1996.

APPROVAL

FY 1996 SCIENTIFIC AND TECHNICAL REPORTS, ARTICLES, PAPERS, AND PRESENTATIONS

Compiled by Joyce E. Turner Waits

The information in this report has been reviewed for technical content. Review of any information concerning Department of Defense or nuclear energy activities or programs has been made by the MSFC Security Classification Officer. This report, in its entirety, has been determined to be unclassified.

Tereasa H. Washington
Director
Human Resources and Administrative Support Office
This document presents formal NASA technical reports, papers published in technical journals, and presentations by MSFC personnel in FY96. It also includes papers of MSFC contractors.

After being announced in STAR, all of the NASA series reports may be obtained from the National Technical Information Service, 5285 Port Royal Road, Springfield, VA 22161.

The information in this report may be of value to the scientific and engineering community in determining what information has been published and what is available.
