Abstract

Aircraft engine combustors generally involve turbulent swirling flows in order to enhance fuel-air mixing and flame stabilization. It has long been recognized that eddy viscosity turbulence models are unable to appropriately model swirling flows. Therefore, it has been suggested that, for the modeling of these flows, a second order closure scheme should be considered because of its ability in the modeling of rotational and curvature effects. However, this scheme will require solution of many complicated second moment transport equations (six Reynolds stresses plus other scalar fluxes and variances), which is a difficult task for any CFD implementations. Also, this scheme will require a large amount of computer resources for a general combustor swirling flow.

This report is devoted to the development of a cubic Reynolds stress-strain model for turbulent swirling flows, and was inspired by the work of Launder's group at UMIST. Using this type of model, one only needs to solve two turbulence equations, one for the turbulent kinetic energy $k$ and the other for the dissipation rate $\varepsilon$. The cubic model developed in this report is based on a general Reynolds stress-strain relationship (Shih and Lumley, 1993). Two flows have been chosen for model evaluation. One is a fully developed rotating pipe flow, and the other is a more complex flow with swirl and recirculation.

### 1 Introduction

For better fuel-air mixing and flame stabilization in a combustor, a swirl is generally associated with the flows. Therefore, accurate modeling of turbulent swirling flows is important in engine combustor design. Common turbulence models used in engineering calculations are eddy viscosity models which include zero-equation and two-equation models (e.g., mixing length models and $k-\varepsilon$ models). However, it has long been recognized that this type of eddy viscosity model is not appropriate for predicting swirling flows. In fact, the deficiency
of eddy viscosity models for swirling flows can be analytically demonstrated by modeling a fully developed rotating pipe flow (Fu, 1995). Measured swirl velocity in the pipe varies approximately as the square of the normalized radius \( r^2 \), however, eddy viscosity models produce an exact linear profile of the swirl velocity, which describes a solid body rotation.

To avoid this kind of deficiency of eddy viscosity models, a second order closure scheme has been suggested for modeling of swirling flows because of its ability to simulate the effects of mean rotation and curvature. However, this requires solving many complicated second moment transport equations, which involve six Reynolds stresses plus other scalar fluxes and variances. Because of this complexity and because of the large computer resources required, second moment transport equation models have not been successfully implemented in combustor swirling flows.

Recent developments in nonlinear Reynolds stress-strain models bring a practical method for combustion flow calculations because of their potential in simulating turbulent swirling flows with only two modeled turbulence transport equations (Craft et al, 1993). Further development and evaluation of these models are of great interest to both CFD development and modern aircraft engine combustor design.

The model developed in this report is based on a general Reynolds stress-strain relationship which is an explicit expression for the Reynolds stresses in terms of a tensorial polynomial of mean velocity gradients. It is derived from a generalized Cayley-Hamilton relation. This general formulation contains terms up to the sixth power of the mean velocity gradient with eleven undetermined coefficients. Obviously, for any practical application, we need to truncate this polynomial. Shih, Zhu and Lumley (1995) suggested a quadratic formulation and determined the three relevant coefficients by using the realizability constraints of Reynolds stresses and a result from rapid distortion theory analysis. This quadratic model works quite successfully for many complex flows including flows with separation. However, our recent calculations of swirling flows show that the swirl velocity is not appropriately predicted, which verifies the finding from Launder's group at UMIST. Launder (1995) pointed out that "the weaknesses of the linear eddy viscosity model can not be rectified by introducing just quadratic terms to the stress-strain relation."

In this report, we retain the cubic terms from a general Reynolds stress-stain formulation and determine the coefficients by using a similar method used in Shih et al's quadratic model and the measured data from rotating pipe flows. Modeled \( k-\varepsilon \) equations are used together with the cubic Reynolds stress-strain model for mean flow calculations. The first test flow is that of fully developed pipe flow rotating about its own axial axis with various rotation rates (Imao, Itoh and Harada, 1996). The second test flow is a more complex flow with swirl and recirculation (Roback and Johnson, 1983). These two flows both have detailed experimental data on mean velocity components. The comparisons between the experimental data and computational results from models will be reported in detail.

In this report, there are four appendices. In Appendix A, the derivation of the proposed cubic model is described. Appendix B gives the equations in a general coordinate system, which
will be useful for studying flows in various curvilinear coordinate systems. For example, axisymmetric flows will be most conveniently studied in a cylindrical coordinate system. Therefore, in Appendix C and Appendix D, we write the equations for a general flow and an axisymmetric flow respectively in a cylindrical coordinate system.

2 Cubic Reynolds stress model

A cubic Reynolds stress model, used in this study for modeling of turbulent swirling flows, is developed in Appendix A. The resultant cubic model can be expressed in terms of mean velocity gradients, $U_{ij}$, or in terms of mean strain and rotation rates, $S_{ij}$ and $\Omega_{ij}$. Here, we list both forms for convenience of their applications.

In terms of mean velocity gradients, the cubic model for Reynolds stresses is

$$
-\rho u_i u_j = \frac{2}{3} \rho k\delta_{ij} + \mu_T \left( U_{ij} + U_{ji} - \frac{2}{3} U_{ik} \delta_{ij} \right)
+ A_2 \rho k^3 \left( U_{ik} U_{kj} - U_{i,k} U_{j,k} \right)
+ A_5 \rho k^4 \left[ U_{ik} U_{kp,j} + U_{k,j} U_{k,p} U_{p,i} - \frac{2}{3} \Pi_3 \delta_{ij} \right]
- \frac{1}{2} I_S \left( U_{i,k} U_{kj} + U_{j,k} U_{ki} - \frac{2}{3} \Pi_1 \delta_{ij} \right)
- \frac{1}{2} I_S \left( U_{i,k} U_{kJ} + U_{j,k} U_{k,j} - \frac{2}{3} \Pi_2 \delta_{ij} \right)
$$

(1)

where $"_j"$ means a tensorial derivative with respect to $j$. $I_S$ is the first principal invariant of $S_{ij}$, i.e., $S_{kk}$. The invariants $\Pi_1, \Pi_2$ and $\Pi_3$ (which appear in Eq.(A.1)) are defined as follows

$$
\Pi_1 = U_{i,j} U_{j,i} , \quad \Pi_2 = U_{i,j} U_{i,j} , \quad \Pi_3 = U_{i,k} U_{i,p} U_{p,i}
$$

(2)

The three coefficients $\mu_T, A_3$ and $A_5$ are

$$
\mu_T = \rho C_\mu f_\mu \frac{k^2}{\epsilon} , \quad \text{or} \quad \mu_T = \rho C_\mu f_\mu \frac{k(k + \sqrt{\nu \epsilon})}{\epsilon}
$$

(3)

$$
C_\mu = \frac{1}{4.0 + A_5 \frac{kU^*}{\epsilon}} , \quad f_\mu = \text{Eq.(22)} , \quad \text{or} \quad \text{Eq.(26)}
$$

(4)

$$
A_3 = \sqrt{1 - \frac{9}{2} \frac{C_\mu \left( \frac{kS^*}{\epsilon} \right)^2}{0.5 + \frac{3}{2} \frac{k^2}{\epsilon^2} \Omega^* S^*}}
$$

(5)
\[ A_5 = \frac{1.6 \mu_T}{\rho k^4 7(S^*)^2 + (\Omega^*)^2} \epsilon^3 \frac{4}{\nu^2} \] (6)

in which

\[ A_5 = \sqrt{6} \cos \phi, \quad \phi = \frac{1}{3} \arccos(\sqrt{6} W^*), \quad W^* = \frac{S_{ij}^* S_{ik}^* S_{kj}^*}{(S^*)^3} \] (7)

\[ U^* = \sqrt{(S^*)^2 + (\Omega^*)^2}, \quad S^* = \sqrt{S_{ij}^* S_{ij}^*}, \quad \Omega^* = \sqrt{\Omega_{ij} \Omega_{ij}} \] (8)

The model coefficient \( C_\mu \) is also constrained by the following conditions:

\[ C_\mu \leq \frac{\sqrt{2}}{3} \left( \frac{k S^*}{\epsilon} \right)^{-1}, \quad \text{and} \quad C_\mu \leq \left( A_5 \frac{k S^*}{\epsilon} \right)^{-1} + \frac{k^2}{\epsilon^2} II_S A_5 \] (9)

where \( II_S \) is defined in Eq. (12).

In terms of mean strain and rotation rates, Eq. (1) can be written as

\[ -\rho u_i u_j = -\frac{2}{3} \rho k \delta_{ij} + \mu_T 2 S_{ij}^* + A_3 \frac{\rho k^3}{\epsilon^2} (S_{ik} \Omega_{kj} - \Omega_{ik} S_{kj}) \]

\[ -2 A_5 \frac{\rho k^4}{\epsilon^3} \left( \Omega_{ik} S_{kj}^2 - S_{ik}^2 \Omega_{kj} + \Omega_{ik} S_{km} \Omega_{mj} - \frac{1}{3} \Omega_{kl} S_{lm} \Omega_{mk} \delta_{ij} + II_S S_{ij}^* \right) \] (10)

where

\[ S_{ij}^* = S_{ij} - \frac{1}{3} S_{kk} \delta_{ij}, \quad S_{ij}^2 = S_{ik} S_{kj}, \quad S_{ij} = \frac{1}{2} (U_{ij} + U_{ji}), \quad \Omega_{ij} = \frac{1}{2} (U_{ij} - U_{ji}) \] (11)

\( II_S \) is the second principal invariant of \( S_{ij} \) defined as

\[ II_S = \frac{1}{2} (S_{kk} S_{mm} - S_{kk}^2) \] (12)

Note that in the above equations, \( S_{kk} \) means \( S_{11} + S_{22} + S_{33} \) and \( S_{kk}^2 \) means \( S_{1p} S_{p1} + S_{2p} S_{p2} + S_{3p} S_{p3} \) in which each term contains a summation operator on the subscript "p".

It should also be mentioned that the eddy viscosity \( \mu_T \) in Eq. (3) will become the standard form of \( \mu_T = \rho C_\mu \frac{k^2}{\epsilon^2} \) for high turbulent Reynolds number flows \( \frac{k^2}{\nu \epsilon} \gg 1 \).
3 Modeling of turbulent swirling flows

The model proposed in the previous section will be used for modeling of swirling flows in this study. The first flow is a fully developed rotating pipe flow (Imao, Itoh and Harada, 1996). This flow was used for model development; however, a pipe flow with various axial rotating rates is still a critical test case for the model. The second flow is a more complex swirling flow with recirculation and separation (Roback and Johnson, 1983), which is often encountered in an aircraft engine combustor.

3.1 Rotating pipe flow

A fully developed rotating pipe flow provides a very clean test case for checking the turbulence model's ability to model swirling flows. As mentioned previously, commonly used eddy viscosity models fail to predict this flow. In fact, one can show that any eddy viscosity model will produce a solution of solid body rotation for a rotating pipe flow, while experimental data shows that the flow is not a solid body rotation. Experiments further demonstrate that the characteristics of a pipe flow changes significantly with the axial rotation rate. For example, for a fixed mass flux, the axial rotation will strongly reduce the pressure drop. In other words, for a fixed pressure drop, the axial rotation will increase the total mass flux. However, standard eddy viscosity models show no such changes at all.

In a fully developed turbulent pipe flow, all the axial gradients, $\partial/\partial x$, and the azimuthal derivatives, $\partial/\partial \theta$, are zero, and so is the radial velocity $V = 0$. The non-zero velocity components are the axial velocity $U$ and the tangential (or swirl) velocity $W = r\Omega$, where $\Omega$ is the angular velocity. Equations for this flow are

\begin{align}
\frac{\partial \rho U}{\partial t} &= -\frac{\partial \bar{P}}{\partial x} + \frac{\partial}{\partial r} \left[ (\mu + \mu_T) \frac{\partial U}{\partial r} \right] + \frac{\partial \tau_{\theta r}}{\partial r} \tag{13} \\
\frac{\partial \rho W}{\partial t} &= \frac{\partial}{\partial r} \left[ (\mu + \mu_T) r \frac{\partial W}{\partial r} \right] - 2 \frac{\partial}{\partial r} [(\mu + \mu_T) r W] + \frac{\partial \tau_{r \theta}}{\partial r} \tag{14} \\
\frac{\partial \rho k}{\partial t} &= \frac{\partial}{\partial r} \left[ \left( \mu + \frac{\mu_T}{\sigma_k} \right) r \frac{\partial k}{\partial r} \right] + r P_k - \rho \varepsilon \tag{15} \\
\frac{\partial \rho \varepsilon}{\partial t} &= \frac{\partial}{\partial r} \left[ \left( \mu + \frac{\mu_T}{\sigma_\varepsilon} \right) r \frac{\partial \varepsilon}{\partial r} \right] + C_{e1} f_1 \frac{r \rho S \varepsilon}{k} - C_{e2} f_2 \frac{r \rho \varepsilon^2}{k} + \frac{\mu_T r}{\rho} \left( \frac{\partial S}{\partial r} \right)^2 \tag{16} \\
\text{or} \quad \frac{\partial \rho \varepsilon}{\partial t} &= \frac{\partial}{\partial r} \left[ \left( \mu + \frac{\mu_T}{\sigma_\varepsilon} \right) r \frac{\partial \varepsilon}{\partial r} \right] + C_{e1} f_1 \frac{r \rho S \varepsilon}{k + \sqrt{\nu \varepsilon}} + \frac{\mu_T r}{\rho} \left( \frac{\partial S}{\partial r} \right)^2 \tag{17}
\end{align}
where \( S = \sqrt{2S_{ij}S_{ij}} = \sqrt{\left(\frac{\partial U}{\partial r}\right)^2 + \left(\frac{\partial W}{\partial r} - \frac{W}{r}\right)^2} \). The nonlinear parts of turbulent stresses, \( \tau_{xx} \) and \( \tau_{\theta r} \), from the proposed cubic model, Eq. (1) or Eq. (10), are

\[
\tau_{xx} = 0 \tag{18}
\]

\[
\tau_{\theta r} = -A_5 \frac{\rho k^4}{\varepsilon^3} \left[ \frac{W}{r} \left( \frac{\partial U}{\partial r} \right)^2 + W \frac{\partial W}{\partial r} \left( \frac{\partial W}{\partial r} - \frac{W}{r} \right) \right] \tag{19}
\]

The production rate of turbulent kinetic energy \( P_k \) is

\[
P_k = \mu_T \left[ \left( \frac{\partial U}{\partial r} \right)^2 + \left( \frac{\partial W}{\partial r} - \frac{W}{r} \right)^2 \right] - A_5 \frac{\rho k^4}{\varepsilon^3} \frac{W}{r} \left( \frac{\partial W}{\partial r} - \frac{W}{r} \right) \left[ \left( \frac{\partial U}{\partial r} \right)^2 + \frac{\partial W}{\partial r} \left( \frac{\partial W}{\partial r} - \frac{W}{r} \right) \right] \tag{20}
\]

where

\[
\mu_T = \rho C_{e} \frac{k^2}{f_{\mu} \varepsilon} \tag{21}
\]

\[
f_{\mu} = \left[ 1 - \exp\left(-a_1 R_k - a_3 R_k^3 - a_5 R_k^5\right) \right]^{1/2} \tag{22}
\]

\[
f_1 = 1, \quad f_2 = 1 - 0.22 \exp\left(-Rt^2/36\right) \tag{23}
\]

and \( a_1 = 1.7 \times 10^{-3}, a_3 = 1 \times 10^{-9}, a_1 = 5 \times 10^{-10}, R_k = \rho \sqrt{k} y/\mu \). Other model constants used in this report are standard: \( \sigma_k = 1, \sigma_\varepsilon = 1.3, C_{e1} = 1.44 \) and \( C_{e2} = 1.92 \). Depending on particular modeled \( k-\varepsilon \) equations, the model coefficients and damping function \( f_{\mu} \) may have different formulations proposed by various researchers. For example, if Eq. (17) \( (Shih et al, 1995) \) is used together with

\[
\mu_T = \rho C_{e} f_{\mu} \frac{k}{5} \frac{k + \sqrt{\varepsilon}}{\varepsilon} \tag{24}
\]

then

\[
C_1 = \max \left\{ 0.43, \frac{\eta}{5 + \eta} \right\}, \quad C_2 = 1.9, \quad \eta = \frac{S k}{\varepsilon} \tag{25}
\]

and \( f_{\mu}, f_1 \) are

\[
f_{\mu} = 1 - \exp\left\{ - \left( a_1 R + a_2 R^2 + a_3 R^3 + a_4 R^4 + a_5 R^5 \right) \right\} \tag{26}
\]

\[
f_1 = 1 - \exp\left\{ - \left( a'_1 R + a'_2 R^2 + a'_3 R^3 + a'_4 R^4 + a'_5 R^5 \right) \right\} \tag{27}
\]

and \( f_{\mu}, f_1 \) are

\[
f_{\mu} = 1 - \exp\left\{ - \left( a_1 R + a_2 R^2 + a_3 R^3 + a_4 R^4 + a_5 R^5 \right) \right\} \tag{26}
\]

\[
f_1 = 1 - \exp\left\{ - \left( a'_1 R + a'_2 R^2 + a'_3 R^3 + a'_4 R^4 + a'_5 R^5 \right) \right\} \tag{27}
\]
\[ f_2 = Eq.(23) \]  

where

\[ R = \frac{k^{1/2} (k + \sqrt{\nu \varepsilon})^{3/2}}{\nu \varepsilon} \]  

and

\[ a_1 = 3.3 \times 10^{-3}, \quad a_2 = -6 \times 10^{-5}, \quad a_3 = 6.6 \times 10^{-7}, \]
\[ a_4 = -3.6 \times 10^{-9}, \quad a_5 = 8.4 \times 10^{-12} \]  

From Eq. (14), it is easy to show that any eddy viscosity model will produce a solution of solid body rotation, i.e., \( W/W_{wall} = \tau/R \), where \( W_{wall} \) is the swirl velocity of the wall and \( R \) is the radius of the pipe. It can also be shown that any quadratic Reynolds stress models will have no contributions to the component \( \tau_{\theta} \) for a fully developed rotating pipe flow. Therefore, they will also produce a solution of solid body rotation, just like an eddy viscosity model does. Equations (13)-(17) can be easily and accurately solved by a parabolic code. Figures 1 - 3 show the results of the present cubic model with Eqs. (15) and (17) compared with the measurements by Imao, et al (1996). The results from the standard \( k-\varepsilon \) eddy viscosity model are also included for comparison. In the figures, the rotation parameter \( N \) is defined as \( N = W_{\theta}/U_m \), where \( U_m \) is the average velocity of the pipe. The Reynolds number based on \( U_m \) and \( R \) is 20000. As shown in these figures, the standard \( k-\varepsilon \) eddy viscosity model has totally missed the effect of axial rotations on the pipe flow. In contrast, the present cubic Reynolds stress model can capture all the effects of the axial rotation on the pipe flow: it increases the centerline velocity and changes the axial velocity profile towards a parabolic shape, it maintains non-solid body swirl velocity profile, and it reduces the relative turbulent kinetic energy \( k/U_m^2 \).

### 3.2 Complex swirling flow with recirculation

A confined swirling coaxial jet was experimentally studied by Roback and Johnson (1983). Figure 4 shows the general features of the flow. At the inlet, an inner jet and an annular jet are ejected into an enlarged duct. Besides an annular separation due to sudden expansion of the duct, a central recirculation bubble is created by the swirling flow. This flow feature is often observed in an aircraft engine combustor. In this figure, calculated velocity vectors in an axisymmetric plane from the cubic model is compared with the one from the standard \( k-\varepsilon \) eddy viscosity model. Solutions were obtained by two Navier-Stokes codes. One is CORSAIR (Liu et al, 1996) and the other is FAST-2D (Zhu, 1991). Eq. (16) and Eq. (17) are respectively used in this calculation. Numerical results from the two codes are quite close to each other. Figure 5 compares the calculations of the centerline velocity using a standard \( k-\varepsilon \) eddy
viscosity model (SKE) and the present cubic model with the experimental data. The negative velocity indicates the central recirculation. It is seen that both models predict the strength of central recirculation quite well, but the present model predicts the rear stagnation point much better than does the SKE model. This is also reflected in Fig. 4 that the recirculation bubble from the cubic model is larger than that from the standard SKE model. Figure 6 shows the comparison of calculated and measured mean velocity profiles at x=51mm. Both models give reasonably good profiles which are within experimental scatter. However, significant differences in the tangential velocity profile between the two models have been found in the downstream region. For example, Fig. 7 shows the swirl velocity profile at x=305mm. SKE model predicts a nearly solid body rotation, whereas the cubic model shows a non-solid body rotation which is consistent with experimental observation.

4 Conclusion and discussion

This study shows that nonlinear cubic Reynolds stress-strain models with modeled k-ε equations have the potential to simulate turbulent swirling flows encountered in aircraft engine combustors. The model proposed in this report appears simple and numerically robust in CFD applications in which the aircraft engine industry is particularly interested. However, further evaluations against other flows are needed in order to determine the flow range of the model's validity and to seek possible further improvements.

The proposed cubic Reynolds stress model can be combined with existing k-ε model equations, yet the best combination needs further studies and evaluations.

The proposed cubic model appears the simplest among other cubic or higher order models; however it requires about 15% more CPU time than does a linear k-ε eddy viscosity model for a general 2D axisymmetric swirling flow. We expect that if a higher order model (e.g., fourth or fifth order) is used, then the CPU time for calculating Reynolds stresses will significantly increase and the model may become very costly for the calculation of a general 3D swirling flow.

Appendix: Development of a Cubic Turbulent Model

A truncated general cubic turbulent stress-strain relation from Shih and Lumley (1993) can be written as

\[-\rho \tilde{u}_i \tilde{u}_j = -\frac{2}{3} \rho k \delta_{ij} + C_\mu \frac{k^2}{\varepsilon} (U_{i,j} + U_{j,i} - \frac{2}{3} U_{k,k} \delta_{ij}) + C_1 \frac{\rho k^3}{\varepsilon^2} (U_{i,k} U_{k,j} + U_{j,k} U_{k,i} - \frac{2}{3} \Pi_1 \delta_{ij}) + C_2 \frac{\rho k^3}{\varepsilon^2} (U_{i,k} U_{j,k} - \frac{1}{3} \Pi_2 \delta_{ij}) + C_3 \frac{\rho k^3}{\varepsilon^2} (U_{k,i} U_{k,j} - \frac{1}{3} \Pi_2 \delta_{ij}) + C_4 \frac{\rho k^4}{\varepsilon^3} (U_{i,k} U_{j,p} U_{p,k} + U_{i,p} U_{p,k} U_{j,k} - \frac{2}{3} \Pi_3 \delta_{ij}) + C_5 \frac{\rho k^4}{\varepsilon^3} (U_{k,i} U_{k,p} U_{p,j} + U_{k,j} U_{k,p} U_{p,i} - \frac{2}{3} \Pi_3 \delta_{ij}) \]  

(A.1)

The six model coefficients in Eq.(A.1) will be determined by the following procedure. First, we consider two extreme cases: a pure strain flow and a pure shear flow, and apply realizability constraints on the Reynolds stresses to ensure positive energy components and Schwarz' inequality. This was suggested by Reynolds (1987) and Shih et al (1995), which will allow us to determine the model coefficients of $C_\mu, C_1, C_2$ and $C_3$. The second procedure is to determine the model coefficients $C_4$ and $C_5$ by using the experimental data of a fully developed rotating pipe flow. To analyze the pure strain and pure shear flows, it is more convenient to write Eq.(A.1) in terms of mean strain and rotation rates, as in the following:

\[-\rho \tilde{u}_i \tilde{u}_j = -\frac{2}{3} \rho k \delta_{ij} + C_\mu \frac{k^2}{\varepsilon} 2S_{ij}^{*} + C_1 \frac{\rho k^3}{\varepsilon^2} 2(S_{ij}^{(2*)} + \Omega_{ij}^{(2*)}) + C_2 \frac{\rho k^3}{\varepsilon^2} (S_{ij}^{(2*)} - \Omega_{ij}^{(2*)} - S_{ik}^{*} \Omega_{kj} + \Omega_{ik} S_{k}^{*}) + C_3 \frac{\rho k^3}{\varepsilon^2} (S_{ij}^{(2*)} - \Omega_{ij}^{(2*)} + S_{ik}^{*} \Omega_{kj} - \Omega_{ik} S_{k}^{*}) + 2C_4 \frac{\rho k^4}{\varepsilon^3} (S_{ij}^{(3*)} - S_{ik}^{(2*)} \Omega_{kj} + \Omega_{ik} S_{k}^{(2*)} - \Omega_{ik} S_{km} \Omega_{mj} + \frac{1}{3} \Omega_{ki} S_{lm} \Omega_{mk} \delta_{ij}) + 2C_5 \frac{\rho k^4}{\varepsilon^3} (S_{ij}^{(3*)} + S_{ik}^{(2*)} \Omega_{kj} - \Omega_{ik} S_{k}^{(2*)} - \Omega_{ik} S_{km} \Omega_{mj} + \frac{1}{3} \Omega_{ki} S_{lm} \Omega_{mk} \delta_{ij}) \]  

(A.2)

where

\[S_{ij}^{*} = S_{ij} - \frac{1}{3} S_{kk} \delta_{ij} \quad S_{ij}^{(2*)} = S_{ij}^2 - \frac{1}{3} S_{kk}^2 \delta_{ij} \quad \Omega_{ij}^{(2*)} = \Omega_{ij}^2 - \frac{1}{3} \Omega_{kk}^2 \delta_{ij} \quad S_{ij}^{(3*)} = S_{ij}^3 - \frac{1}{3} S_{kk}^3 \delta_{ij} \quad S_{ij} = S_{ij} \quad \Omega_{ij} = \Omega_{ij} \]
\[ S_{ij}^{3} = S_{im}S_{mj}S_{ij}, \quad S_{ij} = \frac{1}{2}(U_{i,j} + U_{j,i}) , \quad \Omega_{ij} = \frac{1}{2}(U_{i,j} - U_{j,i}) \]  
(A.3)

Note that \( S_{ij}^{*}, S_{ij}^{(2*)}, \Omega_{ij}^{(2*)} \) and \( S_{ij}^{(3*)} \) are all traceless tensors. Using Cayley-Hamilton relation,

\[ S_{ij}^{3} - I_{S}S_{ij}^{2} + II_{S}S_{ij} - III_{S}\delta_{ij} = 0 \]  
(A.4)

\( S_{ij}^{(3*)} \) can be expressed in terms of quadratic and linear terms as

\[ S_{ij}^{(3*)} = I_{S}S_{ij}^{(2*)} - II_{S}S_{ij}^{*} \]  
(A.5)

where \( I_{S}, II_{S} \) and \( III_{S} \) are the three principal invariants of \( S_{ij} \):

\[ I_{S} = S_{ii}, \quad II_{S} = \frac{1}{2} \left( S_{kk}S_{mm} - S_{kk}^{2} \right) , \quad III_{S} = \frac{1}{6} \left( S_{ii}S_{jj}S_{kk} - 3S_{ii}S_{jj}^{2} + 2S_{ii}^{3} \right) \]  
(A.6)

Using Eq.(A.5), we may write Eq.(A.2) as

\[
-\mu \delta_{ij} + C_{\mu} \frac{\rho k^{2}}{\varepsilon} 2S_{ij}^{*} + 2A_{1} \frac{\rho k^{3}}{\varepsilon^{2}} \Omega_{ij}^{(2*)} + 2A_{2} \frac{\rho k^{3}}{\varepsilon^{2}} \Omega_{ij}^{(2*)} \\
+ A_{3} \frac{\rho k^{3}}{\varepsilon^{2}} \left( S_{ik}^{*} \Omega_{kj} - \Omega_{ik} S_{kj}^{*} \right) + 2A_{4} \frac{\rho k^{4}}{\varepsilon^{3}} \left( S_{ik}^{(2*)} \Omega_{kj} - \Omega_{ik} S_{kj}^{(2*)} \right) \\
- 2A_{5} \frac{\rho k^{4}}{\varepsilon^{3}} \left( \Omega_{ik} S_{km} \Omega_{mij} - \frac{1}{3} \Omega_{ki} S_{lm} \Omega_{mij} \delta_{ij} \right) + II_{S} S_{ij}^{*} - I_{S} S_{ij}^{(2*)} 
\]  
(A.7)

where

\[ A_{1} = \frac{1}{2}(2C_{1} + C_{2} + C_{3}) , \quad A_{2} = \frac{1}{2}(2C_{1} - C_{2} - C_{3}) \]
\[ A_{3} = C_{3} - C_{2} , \quad A_{4} = (C_{5} - C_{4}) , \quad A_{5} = (C_{4} + C_{5}) \]  
(A.8)

A result from a rapid distortion theory analysis (Reynolds, 1987) states that isotropic turbulence should not be affected by a pure mean rotation. To satisfy this result, the simplest way is to eliminate the pure rotation term in Eq.(A.7), i.e., \( A_{2} = 0 \), which indicates that \( 2C_{1} = C_{2} + C_{3} \).

To determine the model coefficients, let us first consider a pure strain flow, in which \( \Omega_{ij} = 0 \). Under this situation,

\[ \mu \delta_{ij} + C_{\mu} \frac{k^{2}}{\varepsilon^{2}} II_{S} A_{5} \frac{\rho k^{2}}{\varepsilon^{2}} 2S_{ij}^{*} - (A_{1} + \frac{k}{\varepsilon} I_{S} A_{5}) \frac{\rho k^{3}}{\varepsilon^{2}} 2S_{ij}^{(2*)} \]  
(A.9)

In principal axes of \( S_{ij}^{*} \), we may write (see Shih, Zhu and Lumley, 1995)
\[ S_{ij}^* = \begin{bmatrix} 1 & 0 & 0 \\ 0 & -\frac{1+a}{2} & 0 \\ 0 & 0 & -\frac{1-a}{2} \end{bmatrix} S_{11}^*, \quad S_{ij}^{(2*)} = \begin{bmatrix} 1 & 0 & 0 \\ 0 & -\frac{1+b}{2} & 0 \\ 0 & 0 & -\frac{1+b}{2} \end{bmatrix} S_{11}^{(2*)} \]  

where \( a \) and \( b \) can take on arbitrary values. Then, one may write

\[ \rho u_i^2 = \frac{2}{3} \rho k^2 - (C\mu - \frac{k^2}{\varepsilon^2} I S A_s) \frac{\rho k^2}{\varepsilon} 2S_{11}^* - (A_1 + \frac{k}{\varepsilon} I S A_s) \frac{\rho k^3}{\varepsilon^2} 2S_{11}^{(2*)} \]  

If we define

\[ S^* = \sqrt{S_{ij}^* S_{ij}^*}, \quad S^{(2*)} = \sqrt{S_{ij}^{(2*)} S_{ij}^{(2*)}} \]  

from Eq.(A.10), we obtain

\[ S^* = |S_{11}^*| \sqrt{\frac{3 + a^2}{2}}, \quad S^{(2*)} = |S_{11}^{(2*)}| \sqrt{\frac{3 + b^2}{2}} \]  

Therefore, Eq.(A.11) may be written as

\[ \rho u_i^2 = \frac{2}{3} \rho k^2 - (C\mu - \frac{k^2}{\varepsilon^2} I S A_s) \frac{k \rho k^2}{\varepsilon} 2S^* \sqrt{\frac{2}{3 + a^2}} - (A_1 + \frac{k}{\varepsilon} I S A_s) \frac{\rho k^3}{\varepsilon^2} 2S^{(2*)} \sqrt{\frac{2}{3 + b^2}} \]  

Since \( u_i^2 \geq 0 \), we must require the following inequality for any large \( S^* \) and \( S^{(2*)} \)

\[ 1 - (C\mu - \frac{k^2}{\varepsilon^2} I S A_s) \frac{k}{\varepsilon} S^* \sqrt{\frac{18}{3 + a^2}} - (A_1 + \frac{k}{\varepsilon} I S A_s) \frac{k^2}{\varepsilon^2} S^{(2*)} \sqrt{\frac{18}{3 + b^2}} \geq 0 \]  

If we write

\[ (C\mu - \frac{k^2}{\varepsilon^2} I S A_s) \frac{k}{\varepsilon} S^* \sqrt{\frac{18}{3 + a^2}} = \alpha, \quad (A_1 + \frac{k}{\varepsilon} I S A_s) \frac{k^2}{\varepsilon^2} S^{(2*)} \sqrt{\frac{18}{3 + b^2}} = \beta \]  

then we must require

\[ \alpha + \beta \leq 1 \]  

while we write

\[ (C\mu - \frac{k^2}{\varepsilon^2} I S A_s) = \frac{\alpha}{k S^* \sqrt{\frac{18}{3 + a^2}}}, \quad (A_1 + \frac{k}{\varepsilon} I S A_s) = \frac{\beta}{k^2 S^{(2*)} \sqrt{\frac{18}{3 + b^2}}} \]
Following Shih, Zhu and Lumley (1995), for simplicity we set $\beta = 0$, i.e., $A_1 = -\frac{k}{\varepsilon} I S A_5$, which indicates $C_2 + C_3 = -\frac{k}{\varepsilon} I S A_5$. Then, $\alpha$ must be less than unity, i.e.,

$$
(C_\mu - \frac{k^2}{\varepsilon^2} I S A_5) \leq \frac{1}{A S - \frac{k S^*}{\varepsilon}}
$$

(A.19)

where $A S$ equals $\sqrt{\frac{18}{3 + a^2}}$ and can be calculated using the following relations [see Shih et al (1995), or Reynolds (1987)]:

$$
A_S = \sqrt{6} \cos \phi, \quad \phi = \frac{1}{3} \arccos(\sqrt{6} W^*), \quad W^* = \frac{S^*_{ij} S^*_k S^*_l}{(S^*)^3}
$$

(A.20)

From Eq.(A.19), $C_\mu$ can be written as

$$
C_\mu \leq \frac{1}{A S - \frac{k S^*}{\varepsilon}} + \frac{k^2}{\varepsilon^2} I S A_5
$$

(A.21)

Now, let us consider a pure shear flow, in which there is only one non-zero component, $U_{1,2}$, i.e.,

$$
U_{i,j} = \begin{pmatrix}
0 & U_{1,2} & 0 \\
0 & 0 & 0 \\
0 & 0 & 0
\end{pmatrix}
$$

In this case, $S_{12} = \Omega_{12} = \frac{1}{2} U_{1,2}$. Under this situation, we obtain from Eq.(A.7)

$$
\rho \bar{u}_1^2 = \frac{2}{3} \rho k + 2A_3 \frac{\rho k^3}{\varepsilon^2} S_{12} \Omega_{12}
$$

(A.22)

$$
\rho \bar{u}_2^2 = \frac{2}{3} \rho k - 2A_3 \frac{\rho k^3}{\varepsilon^2} S_{12} \Omega_{12}
$$

(A.23)

$$
\rho \bar{u}_1 \bar{u}_2 = -2C_\mu \frac{\rho k^2}{\varepsilon} S_{12}
$$

(A.24)

Note that in Eqs. (A.22)-(A.24), the condition $(A_1 + \frac{k}{\varepsilon} I S A_5) = 0$ has been used, and note also that $A_3$ must be positive since the shear $U_{1,2}$ will make $\bar{u}_1^2$ increase and $\bar{u}_2^2$ decrease. Applying
Schwarz' inequality, \((u_1u_2)^2 \leq \bar{u}_1^2 \bar{u}_2^2\), to the above equations, we obtain a constraint for \(A_3\):

\[
A_3 \leq \frac{\sqrt{1 - 9C_\mu^2 k^2 S_{12} S_{12}}}{3k^2 S_{12} \Omega_{12}}
\]  

(A.25)

Noting that \((S*)^2 = 2S_{12} S_{12}\) and \(\Omega* S* = 2\Omega_{12} S_{12}\) for the pure shear flow, a generalized expression for \(A_3\) may be written as

\[
A_3 = \frac{\sqrt{1 - \frac{9}{2} C_\mu^2 \left(\frac{kS*}{\varepsilon}\right)^2}}{\frac{C_0}{2} + \frac{3k^2}{2\varepsilon^2} \Omega* S^*}
, \quad C_0 \geq 0
\]

(A.26)

where

\[
\Omega* = \sqrt{\Omega_{ij} \Omega_{ij}}
\]  

(A.27)

To ensure a positive real value of \(A_3\), the coefficient \(C_\mu\) must be also restricted by the following condition for any large values of \(S*\):

\[
C_\mu \leq \frac{\sqrt{2}}{3} \left(\frac{kS*}{\varepsilon}\right)^{-1}
\]  

(A.28)

The formulations for \(C_\mu\) and \(A_3\), i.e., Eqs. (A.21) and (A.26), will ensure realizability of turbulent stresses. However, \(A_4\) and \(A_5\) are left to be further determined, which are related to the coefficients \(C_4\) and \(C_5\) by Eq.(A.8).

To determine \(A_4\) and \(A_5\), or \(C_4\) and \(C_5\), let us study a fully developed rotating pipe flow. In this case, only two components of the non-linear part of turbulent stresses, \(\tau_{x\tau}\) and \(\tau_{\theta\tau}\), appear in the mean flow equations, i.e., Eqs. (13) and (14), which are

\[
\tau_{x\tau} = -C_4 \rho k^4 \frac{W}{\varepsilon^3} \left(\frac{\partial W}{\partial r} - \frac{W}{r}\right) \frac{\partial U}{\partial r}
\]

(A.29)

\[
\tau_{\theta\tau} = -C_4 \rho k^4 \frac{W}{\varepsilon^3} \left(\frac{\partial W}{\partial r} - \frac{W}{r}\right) - C_5 \rho k^4 \left[ W \left(\frac{\partial U}{\partial r}\right)^2 + W \frac{\partial W}{\partial r} \left(\frac{\partial W}{\partial r} - \frac{W}{r}\right) \right]
\]

(A.30)

Now integrate the Eq. (14) for the velocity \(W\) component at a steady state to obtain
Experimental data show that $\frac{W}{W_{wall}} \approx \left(\frac{r}{R}\right)^2$ for a large range of $W_{wall}$. Here, $R$ is the radius of the pipe, $W_{wall}$ is the wall swirl velocity. Insert this relation into the above equation, we obtain, for high turbulent Reynolds numbers,

$$
\mu_T - C_4 \frac{\rho k^4}{\varepsilon^3} 2 \frac{r^2}{R^4} W_{wall}^2 - C_5 \frac{\rho k^4}{\varepsilon^3} \left[ 2 \frac{r^2}{R^4} W_{wall}^2 + \left( \frac{\partial U}{\partial r} \right)^2 \right] \approx 0 \quad (A.32)
$$

If we write

$$
C_4 \frac{\rho k^4}{\varepsilon^3} 2 \frac{r^2}{R^4} W_{wall}^2 = \alpha' \mu_T, \quad C_5 \frac{\rho k^4}{\varepsilon^3} \left[ 2 \frac{r^2}{R^4} W_{wall}^2 + \left( \frac{\partial U}{\partial r} \right)^2 \right] = \beta' \mu_T \quad (A.33)
$$

then from Eq. (A.32), we must require $\alpha' + \beta' \approx 1$. The coefficients $C_4$ and $C_5$ can be expressed as

$$
C_4 = \frac{\frac{\alpha' \mu_T}{\rho k^4 2 \frac{r^2}{R^4} W_{wall}^2}}{\frac{\varepsilon^3}{2}}, \quad C_5 = \frac{\frac{\beta' \mu_T}{\rho k^4 2 \frac{r^2}{R^4} W_{wall}^2 + \left( \frac{\partial U}{\partial r} \right)^2}}{\frac{\varepsilon^3}{4}} \quad (A.34)
$$

In a fully developed, rotating, pipe flow, we find that the following relations hold,

$$
2 \frac{r^2 W_{wall}^2}{R^4} = \frac{1}{2} \left| S_{ij}^* S_{ij}^* - \Omega_{ij} \Omega_{ij} \right| \quad (A.35)
$$

$$
\left[ 2 \frac{r^2 W_{wall}^2}{R^4} + \left( \frac{\partial U}{\partial r} \right)^2 \right] = \frac{1}{4} \left( 7 S_{ij}^* S_{ij}^* + \Omega_{ij} \Omega_{ij} \right) \quad (A.36)
$$

Finally, we obtain expressions for $C_4$ and $C_5$ as follows

$$
C_4 = \frac{\alpha' \mu_T}{\rho k^4 1 \frac{\varepsilon^3}{2} \left| (S^*)^2 - (\Omega^*)^2 \right|} \quad (A.37)
$$

$$
C_5 = \frac{\beta' \mu_T}{\rho k^4 1 \frac{\varepsilon^3}{4} \left( 7 (S^*)^2 + (\Omega^*)^2 \right)} \quad (A.38)
$$
From the calculation of rotating pipe flows, we find that the following coefficients seem appropriate (i.e., we set $\alpha' = 0$, $\beta' = 1.6$):

$$C_\mu = \frac{1}{4.0 + A_5 \frac{kU^*}{\varepsilon}}$$  \hspace{1cm} (A.39)

$$C_4 = 0$$  \hspace{1cm} (A.40)

$$C_5 = \frac{1.6 \mu_T}{\frac{\rho k^4 7(S^*)^2 + (\Omega^*)^2}{\varepsilon^3}}$$  \hspace{1cm} (A.41)

where

$$U^* = \sqrt{\frac{S_{ij} S_{ij}^* + \Omega_{ij} \Omega_{ij}}}, \quad S^* = \sqrt{S_{ij}^* S_{ij}^*}, \quad \Omega^* = \sqrt{\Omega_{ij} \Omega_{ij}}$$  \hspace{1cm} (A.42)

Equations (A.40) and (A.8) suggest that $A_4 = A_5 = C_5$.

Now, we may summarize the cubic model and its coefficients as follows:

$$-\rho \bar{u}_i \bar{u}_j = -\frac{2}{3} \rho k \delta_{ij} + \mu_T 2S_{ij}^* + A_3 \frac{\rho k^3}{\varepsilon^2} (S_{ik} \Omega_{kj} - \Omega_{ik} S_{kj})$$

$$-2A_5 \frac{\rho k^4}{\varepsilon^3} \left( \Omega_{ik} S_{kj}^2 - S_{ik}^2 \Omega_{kj} + \Omega_{ik} S_{km} \Omega_{mj} \right)$$

$$- \frac{1}{3} \Omega_{kl} S_{lm} \Omega_{mk} \delta_{ij} + II S_{ij}^*$$  \hspace{1cm} (A.43)

where

$$\mu_T = \text{Eq.}(3)$$  \hspace{1cm} (A.44)

$$C_\mu = \frac{1}{4.0 + A_5 \frac{kU^*}{\varepsilon}}$$  \hspace{1cm} (A.45)

$$A_3 = \frac{\sqrt{1 - \frac{9}{2} C_\mu^2 \left( \frac{kS^*}{\varepsilon} \right)^2}}{0.5 + \frac{3}{2} \frac{k^2}{\varepsilon^2} \Omega^* S^*}$$  \hspace{1cm} (A.46)

$$A_5 = \frac{\rho k^4 7(S^*)^2 + (\Omega^*)^2}{\varepsilon^3}$$  \hspace{1cm} (A.47)

In Eq. (A.43), we have used the fact that $S_{ik}^* \Omega_{kj} - \Omega_{ik} S_{kj}^* = S_{ik} \Omega_{kj} - \Omega_{ik} S_{kj}$ and $\Omega_{ik} S_{kj}^{(2*)} - S_{ik}^{(2*)} \Omega_{kj} = \Omega_{ik} S_{kj}^2 - S_{ik}^2 \Omega_{kj}$. In addition, $C_\mu$ must also be constrained by the conditions from
Eqs. (A.21) and (A.28), i.e.,

\[ C_\mu \leq \left( A_5 \frac{kS^*}{\epsilon} \right)^{-1} + \frac{k^2}{\epsilon^2} I_5 A_5 \] and \[ C_\mu \leq \frac{\sqrt{2}}{3} \left( \frac{kS^*}{\epsilon} \right)^{-1} \] (A.48)

The cubic model can be directly expressed in terms of mean velocity gradients, i.e., Eq. (A.1). The corresponding coefficients are

\[ C_1 = -\frac{1}{2} \frac{k}{\epsilon} I_5 A_5 \] (A.49)
\[ C_2 = -\frac{1}{2} \left( A_3 + \frac{k}{\epsilon} I_5 A_5 \right) \] (A.50)
\[ C_3 = \frac{1}{2} \left( A_3 - \frac{k}{\epsilon} I_5 A_5 \right) \] (A.51)
\[ C_4 = 0 \] (A.52)
\[ C_5 = A_5 \] (A.53)

then the cubic model, Eq.(A.43), becomes

\[-\rho \bar{u}_i \bar{u}_j = -\frac{2}{3} \rho k \delta_{ij} + \mu_T \left( U_{i,j} + U_{j,i} - \frac{2}{3} U_{k,k} \delta_{ij} \right) + \frac{A_3 \rho k^3}{\epsilon^2} \left( U_{k,i} U_{k,j} - U_{i,k} U_{j,k} \right) + A_5 \frac{\rho k^4}{\epsilon^3} \left[ U_{k,i} U_{k,p} U_{p,j} + U_{k,j} U_{k,p} U_{p,i} - \frac{2}{3} \Pi_3 \delta_{ij} \right. - \frac{1}{2} I_5 \left( U_{i,k} U_{k,j} + U_{j,k} U_{i,j} - \frac{2}{3} \Pi_1 \delta_{ij} \right) - \frac{1}{2} I_5 \left( U_{k,i} U_{k,j} + U_{i,k} U_{j,k} - \frac{2}{3} \Pi_2 \delta_{ij} \right) \] (A.54)
B Appendix: Equations in a General Coordinate System

In this appendix, a set of mean flow equations with a general cubic model will be written in a general coordinate system. This appendix will be found useful for studying turbulent flows in a curvilinear coordinate system. We start with the governing equations in general tensorial form. In Appendix C, we will write these equations in a cylindrical coordinate system as an example to show how to write the equations and models for a specific curvilinear coordinate system.

B.1 Equations in tensorial form

\[ \rho, + (\rho U^j)_j = 0 \]  \hspace{1cm} (B.1)

\[ (\rho U_i)_t + (\rho U_i U_j)_j = -P_i + g_{ij} \left[ \mu \left( U_{i,j} + U_{j,i} - \frac{2}{3} U_{k,k} g_{ij} \right) - \rho \bar{u}_i \bar{u}_j \right] \]  \hspace{1cm} (B.2)

\[ (\rho k)_t + (\rho U^i k)_i = g_{ij} \left[ \left( \mu + \frac{\mu_T}{\sigma} \right) k_{j,i} \right] + P_k - \rho \varepsilon \]  \hspace{1cm} (B.3)

\[ (\rho \varepsilon)_t + (\rho U^i \varepsilon)_i = g_{ij} \left[ \left( \mu + \frac{\mu_T}{\sigma} \right) \varepsilon_{j,i} \right] + C_{e1} f_1 \frac{\varepsilon}{k} P_k - C_{e2} f_2 \rho \frac{\varepsilon^2}{k} + C_{e3} \frac{\mu_T}{\rho} g^{ij} S_j S_i \]  \hspace{1cm} (B.4)

where

\[ P_k = g^{kj} (-\rho \bar{u}_i \bar{u}_j) U^i_k, \quad S = \sqrt{2 S_{ij} S^{*}_{ij}} \]  \hspace{1cm} (B.5)

The turbulent stress is written in the following form:

\[ -\rho \bar{u}_i \bar{u}_j = -\frac{2}{3} \rho \sigma_{ij} + \mu_T \left( U_{i,j} + U_{j,i} - \frac{2}{3} U_{k,k} g_{ij} \right) + \tau_{ij} \]  \hspace{1cm} (B.6)

where the subscript "\,i\," denotes a tensorial derivative, \( g^{ij} \) and \( g_{ij} \) are the two metric tensors of a coordinate system, which are defined in Eq.(B.16). The nonlinear part of the general cubic model, \( \tau_{ij} \), is

\[ \tau_{ij} = C_1 \frac{\rho k^3}{\varepsilon^2} \left( U_{i,k} U^k_j + U_{j,k} U^k_i - \frac{2}{3} \Pi_1 g_{ij} \right) + C_2 \frac{\rho k^3}{\varepsilon^2} \left( \eta^{kl} U_{i,k} U_{j,l} - \frac{1}{3} \Pi_2 g_{ij} \right) + C_3 \frac{\rho k^3}{\varepsilon^2} \left( U_{i,k} U^k_j - \frac{1}{3} \Pi_2 g_{ij} \right) \]
\[ + C_4 \frac{\partial k^4}{\varepsilon^3} \left( g^{kl} U_{i,k} U_{j,l} U_{i,j} + g^{kl} U_{i,p} U_{k,p} - \frac{2}{3} \Pi_3 g_{ij} \right) \]
\[ + C_5 \frac{\partial k^4}{\varepsilon^3} \left( U_{i,k} U_{j,p} U_{i,p} + U_{k,i} U_{j,k} - \frac{2}{3} \Pi_3 g_{ij} \right) \quad \text{(B.7)} \]

where,
\[ \Pi_1 = U_{i,k} U_{j,l}, \quad \Pi_2 = g^{kl} U_{i,k} U_{j,l}, \quad \Pi_3 = g^{kl} U_{i,m} U_{j,m} \quad \text{(B.8)} \]

In addition, the often used scalar parameters \( S^* \) and \( \Omega^* \) defined in Eq.(A.42) and \( W^* \) in Eq.(A.20) can be written as
\[ (S^*)^2 = \frac{1}{2} \left( g^{ij} U_{k,i} U_{j,k} + U_{i,j} U_{i,j} \right) - \frac{1}{3} (U_{i,i})^2 \quad \text{(B.9)} \]
\[ (\Omega^*)^2 = \frac{1}{2} \left( g^{ij} U_{k,i} U_{j,k} - U_{i,j} U_{i,j} \right) \quad \text{(B.10)} \]
\[ W^* = g^{ij} g^{km} S_{ik}^* S_{im}^* S_{nj}^* \quad \text{(B.11)} \]

The nonlinear part of turbulent stress \( \tau_{ij} \), Eq. (B.7), can also be expressed in terms of mean strain and rotation rates \( S_{ij} \) and \( \Omega_{ij} \) which will be listed in Eq. (B.33).

### B.2 Equations in a general coordinate system

Let \( x^i \) represent a general curvilinear coordinate system, then the corresponding contravariant velocity is defined as \( U^i = \frac{dx^i}{dt} \) and the covariant velocity is defined as \( U_i = g_{ij} U^j \). To write Eqs. (B.1)-(B.10) in this general coordinate system, we need the following expressions for various tensorial derivatives:

\[ A_{i,j} = \frac{\partial A_i}{\partial x^j} - \Gamma^q_{ij} A_q \]
\[ A^i_j = \frac{\partial A^i}{\partial x^j} + \Gamma^q_{ij} A^q \]
\[ A_{ij,k} = \frac{\partial A_{ij}}{\partial x^k} - \Gamma^q_{ik} A_{q,j} - \Gamma^q_{jk} A_{i,q} \]
\[ A^i_{jk} = \frac{\partial A^i_j}{\partial x^k} - \Gamma^q_{ik} A^j_q + \Gamma^q_{jk} A^i_q \quad \text{(B.12)} \]

where \( \Gamma^i_{jk} \) is a Cristoffel symbol defined in Eq.(B.17). With the above formulations, Eqs. (B.1)-(B.10) can be written as follows
\[ \rho_{,t} + \frac{\partial \rho U^i}{\partial x^j} + \Gamma^j_{jn} \rho U^n = 0 \quad \text{(B.13)} \]
\[(\rho U_i)_t + \frac{\partial \rho U_j U^j}{\partial x^i} - \Gamma^i_{ij} \rho U_j U^n + \Gamma^i_{jn} \rho U_i U^n = -\frac{\partial P}{\partial x^i} + g^{ir} \frac{\partial}{\partial x^r} \left[ (\mu + \mu_T) \left( \frac{\partial U_i}{\partial x^j} + \frac{\partial U_j}{\partial x^i} - \frac{2}{3} \Theta g_{ij} \right) \right] - g^{ir} \left\{ 2(\mu + \mu_T) U_n \frac{\partial \Gamma^i_{jn}}{\partial x^r} + 2 \Gamma^i_{ij} \frac{\partial}{\partial x^r} [(\mu + \mu_T) U_n] \right\} - g^{ir} \Gamma^p_{jr} (\mu + \mu_T) \left( \frac{\partial U_i}{\partial x^p} + \frac{\partial U_p}{\partial x^i} - 2 \Gamma_{ip} U_n - \frac{2}{3} \Theta g_{ip} \right) - g^{ir} \Gamma^p_{jr} (\mu + \mu_T) \left( \frac{\partial U_i}{\partial x^p} + \frac{\partial U_p}{\partial x^i} - 2 \Gamma_{ip} U_n - \frac{2}{3} \Theta g_{ip} \right) + g^{ir} \left( \frac{\partial \tau_{ij}}{\partial x^r} - \Gamma^r_{ir} \tau_{nj} - \Gamma^r_{jr} \tau_{in} \right) \] (B.14)

where

\[\Theta = U^k_{,k} = \frac{\partial U^k}{\partial x^k} + \Gamma^k_{kn} U^n\] (B.15)

and

\[g^{ij} = \frac{\partial x^i}{\partial \chi^k} \frac{\partial x^j}{\partial \chi^k}, \quad g_{ij} = \frac{\partial \chi^k}{\partial x^i} \frac{\partial \chi^l}{\partial x^j} \] (B.16)

here \(\chi^k\) denotes the Cartesian coordinate system while \(x^i\) represents a general coordinate system. The symbol \(\Gamma^i_{jk}\), called the Christoffel symbol, is defined as

\[\Gamma^i_{jk} = \frac{\partial x^i}{\partial \chi^p} \frac{\partial}{\partial \chi^l} \left( \frac{\partial \chi^p}{\partial x^k} \right) \] (B.17)

The equations for the turbulent kinetic energy, \(k = g^{ij} u_i u_j = \bar{u}_i \bar{u}_i\), and its dissipation rate \(\varepsilon\) can be written as

\[(\rho k)_t + \frac{\partial (\rho U^i k)}{\partial x^i} + \Gamma^i_{in} \rho k U^n = g^{ir} \frac{\partial}{\partial x^r} \left[ (\mu + \mu_T) \frac{\partial k}{\partial x^i} \right] - g^{ir} \Gamma^m_{ir} (\mu + \mu_T) \frac{\partial \Gamma^m_{jn}}{\partial x^r} + P_k - \rho \varepsilon \] (B.18)

\[(\rho \varepsilon)_t + \frac{\partial (\rho U^i \varepsilon)}{\partial x^i} + \Gamma^i_{in} \rho \varepsilon U^n = g^{ir} \frac{\partial}{\partial x^r} \left[ (\mu + \mu_T) \frac{\partial \varepsilon}{\partial x^i} \right] - g^{ir} \Gamma^m_{ir} (\mu + \mu_T) \frac{\partial \varepsilon}{\partial x^m} + C_{e1} f_1 \bar{k} - C_{e2} f_2 \frac{\rho \varepsilon^2}{k} + C_{e3} \frac{\mu_T}{\rho} g^{ir} \frac{\partial S}{\partial x_j} \frac{\partial S}{\partial x^r} \] (B.19)
where

\[ P_k = -g^{kj}\rho u_i u_j \left( \frac{\partial U^i}{\partial x^k} + \Gamma^i_{kn} U^n \right) \]  \hspace{1cm} (B.20)

\[ -\rho u_i u_j = -\frac{2}{3} \rho k g_{ij} + \mu_T \left[ \frac{\partial U_i}{\partial x^i} + \frac{\partial U_j}{\partial x^j} - 2\Gamma^i_{ij} U_n - \frac{2}{3} \Theta g_{ij} \right] + \tau_{ij} \]  \hspace{1cm} (B.21)

If we decompose \( P_k \) into two parts, one due to the linear part of \(-\rho u_i u_j\) and the other due to the nonlinear part, then we may write

\[ P_k = P_k^{(1)} + P_k^{(2)} \]  \hspace{1cm} (B.22)

where

\[ P_k^{(1)} = -\frac{2}{3}(\rho k + \mu_T \Theta) \Theta + g^{kj} \mu_T \left[ \frac{\partial U_i}{\partial x^i} + \frac{\partial U_j}{\partial x^j} - 2\Gamma^i_{ij} U_n \right] \left( \frac{\partial U^i}{\partial x^k} + \Gamma^i_{mk} U^m \right) \]  \hspace{1cm} (B.23)

\[ P_k^{(2)} = g^{kj} \tau_{ij} \left( \frac{\partial U^i}{\partial x^k} + \Gamma^i_{mk} U^m \right) \]  \hspace{1cm} (B.24)

The nonlinear part of the cubic model, Eq. (B.7), in a general coordinate system is

\[ \tau_{ij} = C_1 \frac{\rho k^3}{\epsilon^2} \left( \frac{\partial U_i}{\partial x^k} \frac{\partial U^k}{\partial x^j} + \frac{\partial U_j}{\partial x^k} \frac{\partial U^k}{\partial x^i} \right) \]

\[ + \frac{\partial U_j}{\partial x^k} \Gamma^k_{ij} U^q \right) - \Gamma^q_{ik} U_q \frac{\partial U^k}{\partial x^i} - \frac{\partial U^k}{\partial x^i} \Gamma^k_{ij} U_p U^q \frac{2}{3} \Pi_1 g_{ij} \right) \]

\[ + C_2 \frac{\rho k^3}{\epsilon^2} \left[ g^{kj} \left( \frac{\partial U_i}{\partial x^k} \frac{\partial U^j}{\partial x^l} - \frac{\partial U_i}{\partial x^l} \frac{\partial U^j}{\partial x^k} \right) - \frac{1}{3} \Pi_2 g_{ij} \right] \]

\[ + C_3 \frac{\rho k^3}{\epsilon^2} \left[ \frac{\partial U_i}{\partial x^j} \frac{\partial U^m}{\partial x^l} - \frac{\partial U_i}{\partial x^l} \frac{\partial U^m}{\partial x^j} \right] \Gamma^k_{jm} U_q - \Gamma^p_{ik} U_p \frac{\partial U^j}{\partial x^l} \frac{\partial U^m}{\partial x^k} \right] \]

\[ + C_4 \frac{\rho k^4}{\epsilon^3} \left[ g^{ki} \left( \frac{\partial U_i}{\partial x^k} \frac{\partial U^j}{\partial x^l} \frac{\partial U^m}{\partial x^q} - \frac{\partial U_i}{\partial x^l} \frac{\partial U^j}{\partial x^q} \frac{\partial U^m}{\partial x^k} \right) \Gamma^q_{jm} U_q - \Gamma^p_{ik} U_p \frac{\partial U^j}{\partial x^l} \frac{\partial U^m}{\partial x^k} \right] \]

\[ + \Gamma^q_{ik} \Gamma^q_{jm} U_p U_q \frac{\partial U^m}{\partial x^l} + \Gamma^q_{kj} \Gamma^q_{jm} U_p U_q \frac{\partial U^m}{\partial x^l} - \frac{\partial U_j}{\partial x^l} \frac{\partial U^m}{\partial x^q} \Gamma^q_{jm} U_q \]

\[ - \Gamma^q_{ik} \frac{\partial U_i}{\partial x^m} \frac{\partial U^j}{\partial x^l} \Gamma^q_{jm} U_q + \Gamma^q_{ik} \frac{\partial U^j}{\partial x^l} \frac{\partial U^m}{\partial x^q} \Gamma^q_{jm} U_q \]

\[ + \frac{\partial U_j}{\partial x^l} \frac{\partial U^m}{\partial x^k} \Gamma^q_{jm} U_q \Gamma^q_{rl} U_r + \frac{\partial U_i}{\partial x^l} \frac{\partial U^m}{\partial x^k} \Gamma^q_{jm} U_q \Gamma^q_{rl} U_r \]

\[ + \frac{\partial U_j}{\partial x^l} \frac{\partial U^m}{\partial x^k} \Gamma^q_{jm} U_q \Gamma^q_{rl} U_r - \frac{2}{3} \Pi_3 g_{ij} \]
where

\begin{align}
\Pi_1 &= \left( \frac{\partial U^i}{\partial x_k} + \Gamma_{pk}^i U^p \right) \left( \frac{\partial U^k}{\partial x^i} + \Gamma_{qi}^k U^q \right) \\
\Pi_2 &= g^{ki} \left( \frac{\partial U^i}{\partial x_k} + \Gamma_{pk}^i U^p \right) \left( \frac{\partial U^i}{\partial x^j} - \Gamma_{ij}^i U^q \right) \\
\Pi_3 &= g^{ki} \left( \frac{\partial U^i}{\partial x_k} + \Gamma_{pk}^i U^p \right) \left( \frac{\partial U^i}{\partial x^m} - \Gamma_{ij}^m U^q \right) \left( \frac{\partial U^m}{\partial x^i} + \Gamma_{ij}^m U^n \right)
\end{align}

The scalar strain and rotation rates are

\begin{align}
(S^*)^2 &= \frac{1}{2} \left[ g^{ij} \left( \frac{\partial U_k}{\partial x^i} - \Gamma_{ki}^q U_q \right) \left( \frac{\partial U^k}{\partial x^j} + \Gamma_{ij}^k U^l \right) + \left( \frac{\partial U^i}{\partial x^j} + \Gamma_{qi}^i U^q \right) \left( \frac{\partial U^j}{\partial x^i} + \Gamma_{ij}^i U^l \right) \right] \\
&- \frac{1}{3} \left( \frac{\partial U^i}{\partial x^i} + \Gamma_{ij}^i U^l \right)^2 \\
(\Omega^*)^2 &= \frac{1}{2} \left[ g^{ij} \left( \frac{\partial U_k}{\partial x^i} - \Gamma_{ki}^q U_q \right) \left( \frac{\partial U^k}{\partial x^j} + \Gamma_{ij}^k U^l \right) \right] \\
&- \left( \frac{\partial U^i}{\partial x^j} + \Gamma_{qj}^i U^q \right) \left( \frac{\partial U^j}{\partial x^i} + \Gamma_{ij}^i U^l \right) \\
W^* &= Eq.(B.39)
\end{align}

### B.3 Another form of the cubic model

In terms of strain and rotation rates, the cubic Reynolds stress model can be written as

\begin{align}
-\rho \bar{u}_i \bar{u}_j &= -\frac{2}{3} \rho k g_{ij} + C_{\mu} \frac{\rho k^2}{\varepsilon} \left( S_{ij} - \frac{1}{3} \Theta g_{ij} \right) + \tau_{ij}
\end{align}
where the nonlinear part, \( \tau_{ij} \), is

\[
\tau_{ij} = 2A_1 \frac{\rho k^3}{\epsilon^2} \left( g^{pq} S_{ip} S_{qj} - \frac{1}{3} S^{(2)} g_{ij} \right) + 2A_2 \frac{\rho k^3}{\epsilon^2} \left( g^{pq} \Omega_{ip} \Omega_{qj} - \frac{1}{3} \Omega^{(2)} g_{ij} \right) \\
+ A_3 \frac{\rho k^3}{\epsilon^2} g^{pq} \left( S_{ip} \Omega_{qj} - \Omega_{ip} S_{qj} \right) + 2A_4 \frac{k^4}{\epsilon^3} g^{pq} \left( S_{ip} S_{qr} \Omega_{sj} - \Omega_{ip} S_{qr} S_{sj} \right) \\
- 2A_5 \frac{\rho k^4}{\epsilon^3} \left[ g^{pq} \left( \Omega_{ip} S_{qr} \Omega_{sj} - \frac{1}{3} \Omega S \Omega \right) g_{ij} \right] + II_5 \left( S_{ij} - \frac{1}{3} \Theta g_{ij} \right) \\
- I_S \left( g^{pq} S_{ip} S_{qj} - \frac{1}{3} S^{(2)} g_{ij} \right) 
\]  

(B.33)

where

\[
S_{ij} = \frac{1}{2} \left( \frac{\partial U_i}{\partial x_j} + \frac{\partial U_j}{\partial x_i} - 2 \Gamma_{ij}^k U_k \right), \quad \Omega_{ij} = \frac{1}{2} \left( \frac{\partial U_i}{\partial x_j} - \frac{\partial U_j}{\partial x_i} \right) 
\]

(B.34)

\[
\Theta = g^{pq} S_{pq} \quad S^{(2)} = g^{pq} g^{rs} S_{pr} S_{sq} \quad \Omega^{(2)} = g^{pq} g^{rs} \Omega_{pr} \Omega_{sq} 
\]

(B.35)

\[
\Omega S \Omega = g^{pq} g^{rs} g^{lm} \Omega_{lm} \Omega_{pq} \quad I_5 = \Theta, \quad II_5 = \frac{1}{2} \left( \Theta^2 - S^{(2)} \right) 
\]

(B.36)

and

\[
(S^*)^2 = g^{kp} g^{kq} S_{kl} S_{pq} - \frac{1}{3} \Omega^2 
\]

(B.37)

\[
(\Omega^*)^2 = g^{kp} g^{kq} \Omega_{kl} \Omega_{pq} 
\]

(B.38)

\[
W_* = g^{ij} g^{kl} g^{mn} S_{ik}^* S_{jm}^* S_{nj}^* (S^*)^3
\]

(B.39)

where,

\[
S_{ij}^* = S_{ij} - \frac{1}{3} g_{ij}
\]

Note that Eq. (B.33) appears to be more compact than Eq. (B.25) and may bring some convenience for the CFD implementation.
C Appendix: Equations in Cylindrical Coordinates

C.1 Mean equations

Now, let us write all equations in a cylindrical coordinate system: \( x^i = (x, r, \theta) \). To accomplish this, we need to calculate the metric tensors \( g^{ij} \), \( g_{ij} \) and the Christoffel symbol \( \Gamma^i_{jk} \) for cylindrical coordinates. Let \( \mathcal{X}^i = (x, y, z) \) be the cartesian system. The relation between the two systems is

\[
\begin{align*}
  x = x, & \quad y = r \cos \theta, \quad z = r \sin \theta \\
  \text{or} & \\
  x = x, & \quad r = \sqrt{y^2 + z^2}, \quad \theta = \arctan(z/y)
\end{align*}
\]

We may easily calculate

\[
\frac{\partial x^i}{\partial x^j} = \begin{pmatrix} 1 & 0 & 0 \\ 0 & \cos \theta & \sin \theta \\ 0 & -\sin \theta / r & \cos \theta / r \end{pmatrix}, \quad \frac{\partial \mathcal{X}^i}{\partial x^j} = \begin{pmatrix} 1 & 0 & 0 \\ 0 & \cos \theta & -r \sin \theta \\ 0 & \sin \theta & r \cos \theta \end{pmatrix}
\]

The metric tensors \( g^{ij} \) and \( g_{ij} \) can then be obtained according to Eq. (B.16):

\[
g^{ij} = \begin{pmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1/r^2 \end{pmatrix}, \quad g_{ij} = \begin{pmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & r^2 \end{pmatrix}
\]

and the Christoffel symbol \( \Gamma^i_{jk} \) can be obtained from Eq. (B.17)

\[
\begin{align*}
  \Gamma^1_{jk} = \begin{pmatrix} 0 & 0 & 0 \\ 0 & 0 & 0 \\ 0 & 0 & 0 \end{pmatrix}, \quad \Gamma^2_{jk} = \begin{pmatrix} 0 & 0 & 0 \\ 0 & 0 & 0 \\ 0 & 0 & -r \end{pmatrix}, \quad \Gamma^3_{jk} = \begin{pmatrix} 0 & 0 & 0 \\ 0 & 0 & 1/r \\ 0 & 1/r & 0 \end{pmatrix}
\end{align*}
\]

The contravariant velocity in the cylindrical coordinates is

\[
U^i = (U, V, \Omega)
\]

where \( U \) and \( V \) are the axial and radial velocities, \( \Omega \) is the angular velocity. The corresponding covariant velocity can be obtained from

\[
U_i = g_{ij} U^j = (U, V, r^2 \Omega)
\]
With Eqs.(C.1)-(C.7), the equations for turbulent flows in a cylindrical coordinate system become

**Continuity equation**

\[
\frac{\partial \rho}{\partial t} + \frac{\partial \rho U}{\partial x} + \frac{\partial \rho V}{\partial y} + \frac{\partial \rho \Omega}{\partial \theta} + \frac{\rho V}{r} = 0
\]  

(C.8)

**Momentum equations**

\[
\frac{\partial \rho U}{\partial t} + \frac{\partial \rho U^2}{\partial x} + \frac{\partial \rho U V}{\partial y} + \frac{\partial \rho U \Omega}{\partial \theta} + \rho U = -\frac{\partial P}{\partial x} + \frac{\partial}{\partial x} \left[ 2(\mu + \mu_T) \left( \frac{\partial U}{\partial x} - \frac{1}{3} \Theta \right) \right] + \frac{\partial}{\partial \theta} \left[ (\mu + \mu_T) \left( \frac{\partial U}{\partial \theta} + \frac{\partial V}{\partial r} \right) \right] + \frac{\tau_{zz}}{x} + \frac{\tau_{z\theta}}{r} + \frac{1}{r^2} \frac{\partial}{\partial \theta} \frac{\tau_{z\theta}}{x} + \tau_{zr}
\]  

(C.9)

\[
\frac{\partial \rho V}{\partial t} + \frac{\partial \rho U V}{\partial x} + \frac{\partial \rho \Omega}{\partial \theta} + \frac{\partial \Omega}{\partial y} + \rho V = -\frac{\partial P}{\partial y} \frac{r}{x} \left[ 2(\mu + \mu_T) \left( \frac{\partial V}{\partial y} - \frac{1}{3} \Theta \right) \right] + \frac{\partial}{\partial \theta} \left[ (\mu + \mu_T) \left( \frac{\partial V}{\partial \theta} + \frac{\partial \Omega}{\partial r} \right) \right] - \frac{2}{r} \frac{\partial}{\partial \theta} \left[ (\mu + \mu_T) \Omega \right] + \frac{\tau_{rz}}{x} + \frac{\tau_{r\theta}}{r} + \frac{1}{r^2} \frac{\partial}{\partial \theta} \frac{\tau_{r\theta}}{x} + \frac{1}{r^2} \tau_{rr}
\]  

(C.10)

\[
\frac{\partial \rho r^2 \Omega}{\partial t} + \frac{\partial \rho r^2 \Omega U}{\partial x} + \frac{\partial \rho r^2 \Omega V}{\partial y} + \frac{\partial \rho r^2 \Omega \theta}{\partial \theta} + \rho r^2 \Omega = -\frac{\partial P}{\partial \theta} \frac{r}{x} \left[ 2(\mu + \mu_T) \left( \frac{\partial \Omega}{\partial \theta} + \frac{\partial V}{\partial r} \right) \right] + \frac{\partial}{\partial \theta} \left[ (\mu + \mu_T) \left( \frac{\partial \Omega}{\partial \theta} + \frac{\partial V}{\partial \theta} \right) \right] + 2 \frac{\partial}{\partial \theta} \left[ (\mu + \mu_T) \Omega \right] + \frac{\tau_{\theta z}}{x} + \frac{\tau_{\theta r}}{r} + \frac{1}{r^2} \frac{\partial}{\partial \theta} \frac{\tau_{\theta r}}{x} + \frac{1}{r^2} \tau_{\theta\theta}
\]  

(C.11)

where

\[
\Theta = \frac{\partial U}{\partial x} + \frac{\partial V}{\partial y} + \frac{\partial \Omega}{\partial \theta} + \frac{V}{r}
\]  

(C.12)
\( \bar{P} = P + \frac{2}{3} k \) \quad (C.13)

**k-\varepsilon equations in Cylindrical coordinates**

\[
\begin{align*}
\frac{\partial \rho k}{\partial t} + \frac{\partial \rho U k}{\partial x} + \frac{\partial \rho V k}{\partial r} + \frac{\partial \rho \Omega k}{\partial \theta} + \frac{V}{r} \rho k &= \frac{\partial}{\partial x} \left[ \left( \mu + \frac{\mu_T}{\sigma_k} \right) \frac{\partial k}{\partial x} \right] \\
+ \frac{1}{r} \left( \mu + \frac{\mu_T}{\sigma_k} \right) \frac{\partial k}{\partial r} + P_k - \rho \varepsilon \\
\frac{\partial \rho \varepsilon}{\partial t} + \frac{\partial \rho U \varepsilon}{\partial x} + \frac{\partial \rho V \varepsilon}{\partial r} + \frac{\partial \rho \Omega \varepsilon}{\partial \theta} + \frac{V}{r} \rho \varepsilon &= \frac{\partial}{\partial x} \left[ \left( \mu + \frac{\mu_T}{\sigma_\varepsilon} \right) \frac{\partial \varepsilon}{\partial x} \right] \\
+ \frac{1}{r} \left( \mu + \frac{\mu_T}{\sigma_\varepsilon} \right) \frac{\partial \varepsilon}{\partial r} + C_{1f} \frac{\varepsilon}{k} P_k - C_{2f} \frac{\varepsilon^2}{k} \\
+ C_{3} \frac{\mu_T}{\rho} \left[ \left( \frac{\partial S}{\partial r} \right)^2 + \left( \frac{\partial S}{\partial x} \right)^2 + \left( \frac{\partial S}{\tau \theta} \right)^2 \right] \\
\end{align*}
\] \quad (C.14)

where

\[ P_k = P_k^{(1)} + P_k^{(2)} \] \quad (C.16)

\[ P_k^{(1)} = -\frac{2}{3} (\rho k + \mu_T \Theta) \Theta \]

\[
\begin{align*}
+ \mu_T \left[ 2 \left( \frac{\partial U}{\partial x} \right)^2 + \frac{\partial V}{\partial x} \left( \frac{\partial \Omega}{\partial x} + \frac{\partial U}{\partial r} \right) + \frac{\partial \Omega}{\partial x} \left( r^2 \frac{\partial \Omega}{\partial x} + \frac{\partial U}{\partial \theta} \right) \right] \\
+ \mu_T \left[ \frac{\partial U}{\partial r} \left( \frac{\partial U}{\partial r} + \frac{\partial V}{\partial x} \right) + 2 \left( \frac{\partial V}{\partial x} \right)^2 + \frac{\partial \Omega}{\partial x} \left( r^2 \frac{\partial \Omega}{\partial r} + \frac{\partial V}{\partial \theta} \right) \right] \\
+ \frac{\mu_T}{r^2} \left[ \frac{\partial U}{\partial \theta} \left( \frac{\partial U}{\partial \theta} + r^2 \frac{\partial \Omega}{\partial x} \right) + \frac{\partial V}{\partial \theta} \left( \frac{\partial V}{\partial \theta} + r^2 \frac{\partial \Omega}{\partial r} \right) \right] \\
+ 2 \left( \frac{V}{r} + \frac{\partial \Omega}{\partial \theta} \right) \left( r^2 \frac{\partial \Omega}{\partial \theta} + \frac{\partial V}{\partial \theta} \right) \right] \end{align*}
\] \quad (C.17)

\[ P_k^{(2)} = \tau_{xx} \frac{\partial U}{\partial x} + \tau_{rr} \frac{\partial V}{\partial r} + \tau_{xz} \frac{\partial \Omega}{\partial x} + \tau_{xz} \frac{\partial U}{\partial r} + \tau_{rr} \frac{\partial V}{\partial r} + \tau_{\theta \theta} \left( \frac{\partial \Omega}{\partial \theta} + \frac{\Omega}{r} \right) \]

\[
\begin{align*}
+ \frac{1}{r^2} \left[ \tau_{x \theta} \frac{\partial U}{\partial \theta} + \tau_{\theta \theta} \left( \frac{\partial V}{\partial \theta} - \frac{r \Omega}{r} \right) + \tau_{\theta \theta} \left( \frac{\partial \Omega}{\partial \theta} + \frac{V}{r} \right) \right] \end{align*}
\] \quad (C.18)
After \( g^{ij} \), \( g_{ij} \) and \( \Gamma_{ij}^k \) for the cylindrical coordinate system are calculated, we may use Eq. (B.25) or Eq. (B.33) to calculate all the turbulent stresses automatically through a computer program. However, in the cylindrical coordinate system, most components of \( g^{ij} \), \( g_{ij} \) and \( \Gamma_{ij}^k \) are zero, therefore it is possible to manually write down all the turbulent stresses to avoid many unnecessary null operations in the computer code. We write them here in a general form for the cubic model, so that model users can use their particular model coefficients for their applications. Note that with Eq. (A.8), the coefficients \( C_i \) can be easily obtained from \( A_i \), or vice versa.

\[
\tau_{xz} = C_1 \rho k^3 \left[ 2 \frac{\partial U}{\partial x}^2 + 2 \frac{\partial U}{\partial r} \frac{\partial V}{\partial x} + 2 \frac{\partial U}{\partial \theta} \frac{\partial \Omega}{\partial x} - \frac{2}{3} \Pi_1 \right] + C_2 \rho k^3 \left[ \left( \frac{\partial U}{\partial x} \right)^2 + \left( \frac{\partial U}{\partial r} \right)^2 + \frac{1}{r^2} \left( \frac{\partial U}{\partial \theta} \right)^2 - \frac{1}{3} \Pi_2 \right] + C_3 \rho k^3 \left[ \left( \frac{\partial U}{\partial x} \right)^2 + \left( \frac{\partial V}{\partial x} \right)^2 + r^2 \left( \frac{\partial \Omega}{\partial x} \right)^2 - \frac{1}{3} \Pi_2 \right] + C_4 \rho k^4 \left[ T_{19}^{xz} + T_{20}^{xz} + \ldots + T_{33}^{xz} + T_{34}^{xz} - \frac{2}{3} \Pi_3 \right] + C_5 \rho k^4 \left[ T_{36}^{xz} + T_{37}^{xz} + \ldots + T_{50}^{xz} + T_{51}^{xz} - \frac{2}{3} \Pi_3 \right]
\]

\[
\tau_{xr} = C_1 \rho k^3 \left[ \frac{\partial U}{\partial x} \frac{\partial U}{\partial r} + \frac{\partial U}{\partial \theta} \frac{\partial \Omega}{\partial r} + \frac{\partial U}{\partial \theta} \frac{\partial \Omega}{\partial \theta} + \frac{\partial U}{\partial r} \frac{\partial \Omega}{\partial \theta} \right] + C_2 \rho k^3 \left[ \frac{\partial U}{\partial x} \frac{\partial V}{\partial r} + \frac{\partial U}{\partial \theta} \frac{\partial \Omega}{\partial r} + \frac{\partial U}{\partial \theta} \frac{\partial \Omega}{\partial \theta} - \frac{\partial U}{\partial \theta} \frac{\partial \Omega}{\partial \theta} \right] + C_3 \rho k^3 \left[ \frac{\partial U}{\partial x} \frac{\partial U}{\partial r} + \frac{\partial U}{\partial \theta} \frac{\partial \Omega}{\partial r} + \frac{\partial U}{\partial \theta} \frac{\partial \Omega}{\partial \theta} + r^2 \frac{\partial \Omega}{\partial \theta} \frac{\partial \Omega}{\partial \theta} \right] + C_4 \rho k^4 \left[ T_{19}^{xr} + T_{20}^{xr} + \ldots + T_{33}^{xr} + T_{34}^{xr} \right] + C_5 \rho k^4 \left[ T_{36}^{xr} + T_{37}^{xr} + \ldots + T_{50}^{xr} + T_{51}^{xr} \right]
\]

\[
\tau_{z\theta} = C_1 \rho k^3 \left[ \frac{\partial U}{\partial x} \frac{\partial U}{\partial \theta} + \frac{\partial U}{\partial \theta} \frac{\partial \Omega}{\partial \theta} + \frac{\partial U}{\partial \theta} \frac{\partial \Omega}{\partial \theta} + \frac{\partial U}{\partial \theta} \frac{\partial \Omega}{\partial \theta} - r \Omega \left( \frac{\partial U}{\partial r} + \frac{\partial V}{\partial x} \right) \right] + r V \frac{\partial \Omega}{\partial x} + r^2 \frac{\partial \Omega}{\partial x} \left( \frac{\partial U}{\partial x} + \frac{\partial \Omega}{\partial \theta} \right) + \frac{\partial r \Omega}{\partial \theta} \frac{\partial V}{\partial x} \right] + C_2 \rho k^3 \left[ r^2 \frac{\partial U}{\partial x} \frac{\partial \Omega}{\partial x} + \frac{\partial U}{\partial \theta} \frac{\partial \Omega}{\partial \theta} + \frac{\partial U}{\partial \theta} \frac{\partial \Omega}{\partial \theta} - r \Omega \frac{\partial U}{\partial \theta} + V \frac{\partial U}{\partial \theta} \right]
\]
\( \tau_{rr} = \frac{C_3 \rho k^3}{\varepsilon^2} \left[ \frac{\partial U}{\partial x} \frac{\partial U}{\partial \theta} + \frac{\partial V}{\partial x} \frac{\partial V}{\partial \theta} + r^2 \frac{\partial \Omega}{\partial x} \frac{\partial \Omega}{\partial \theta} \right] + \left( \frac{r \Omega}{\partial \theta} - \frac{2 \Omega}{\partial \theta} \right) \frac{\partial V}{\partial \theta} - \frac{2}{3} \varepsilon_1 \]

\( \tau_{r\theta} = \frac{C_1 \rho k^3}{\varepsilon^2} \left[ \frac{\partial V}{\partial x} \frac{\partial U}{\partial \theta} + \frac{\partial V}{\partial r} \frac{\partial V}{\partial \theta} + \frac{\partial V}{\partial \theta} \frac{\partial \Omega}{\partial \theta} - 2 r \Omega \frac{\partial V}{\partial \theta} - \frac{\partial V}{\partial \theta} \right] + \left( \frac{r \Omega}{\partial \theta} + \frac{2 \Omega}{\partial \theta} \right) \frac{\partial \Omega}{\partial \theta} \frac{\partial V}{\partial \theta} + \left( \frac{\partial V}{\partial \theta} \frac{\partial \Omega}{\partial \theta} \right) + \Omega \frac{\partial V}{\partial \theta} \]

\( \tau_{\theta \theta} = \frac{C_2 \rho k^3}{\varepsilon^2} \left[ \frac{\partial U}{\partial x} \frac{\partial U}{\partial \theta} + \frac{\partial V}{\partial x} \frac{\partial V}{\partial \theta} + \frac{\partial V}{\partial \theta} \frac{\partial \Omega}{\partial \theta} \right] + \left( \frac{r \Omega}{\partial \theta} + \frac{2 \Omega}{\partial \theta} \right) \frac{\partial \Omega}{\partial \theta} \frac{\partial V}{\partial \theta} + \left( \frac{\partial V}{\partial \theta} \frac{\partial \Omega}{\partial \theta} \right) + \Omega \frac{\partial V}{\partial \theta} \]

32
\[-2r\Omega \frac{\partial V}{\partial \theta} + V^2 + r^2\Omega^2 - \frac{1}{3} r^2 \Pi_2 \]

\[+ C_4 \frac{r_k^A}{\varepsilon^3} \left[ r_{19} \theta \theta + \ldots + r_{34} \theta \theta + \frac{2}{3} r^2 \Pi_3 \right] \]

\[+ C_5 \frac{r_k^A}{\varepsilon^3} \left[ r_{36} \theta \theta + \ldots + r_{50} \theta \theta + \frac{2}{3} r^2 \Pi_3 \right] \]

(C.19)

The terms \( T_{19}^{ij} \ldots T_{51}^{ij} \) in the above equations are listed below:

The terms in \( \tau_{xx} \):

\[ T_{19}^{xx} = \frac{\partial U}{\partial x} \left( \frac{\partial U}{\partial x} \frac{\partial U}{\partial x} + \frac{\partial U}{\partial r} \frac{\partial U}{\partial x} + \frac{\partial U}{\partial \theta} \frac{\partial U}{\partial \theta} \right) + \frac{\partial U}{\partial r} \left( \frac{\partial U}{\partial x} \frac{\partial U}{\partial r} + \frac{\partial U}{\partial r} \frac{\partial U}{\partial \theta} + \frac{\partial U}{\partial \theta} \frac{\partial U}{\partial \theta} \right) \]

\[ + \frac{1}{r^2} \frac{\partial U}{\partial \theta} \left( \frac{\partial U}{\partial x} \frac{\partial U}{\partial \theta} + \frac{\partial U}{\partial r} \frac{\partial U}{\partial \theta} + \frac{\partial U}{\partial \theta} \frac{\partial U}{\partial \theta} \right) \]

\[ T_{20}^{xx} = 0 \]

\[ T_{21}^{xx} = 0 \]

\[ T_{22}^{xx} = 0 \]

\[ T_{23}^{xx} = T_{19}^{xx} \]

\[ T_{24}^{xx} = 0 \]

\[ T_{25}^{xx} = 0 \]

\[ T_{26}^{xx} = 0 \]

\[ T_{27}^{xx} = \frac{V}{r^3} \left( \frac{\partial U}{\partial \theta} \right)^2 \]

\[ T_{28}^{xx} = 0 \]

\[ T_{29}^{xx} = 0 \]

\[ T_{30}^{xx} = 0 \]

\[ T_{31}^{xx} = T_{27}^{xx} \]

\[ T_{32}^{xx} = 0 \]

\[ T_{33}^{xx} = 0 \]

\[ T_{34}^{xx} = 0 \]

\[ T_{36}^{xx} = \frac{\partial U}{\partial x} \left( \frac{\partial U}{\partial x} \frac{\partial U}{\partial x} + \frac{\partial U}{\partial r} \frac{\partial U}{\partial x} + \frac{\partial U}{\partial \theta} \frac{\partial U}{\partial \theta} \right) + \frac{\partial V}{\partial x} \left( \frac{\partial V}{\partial x} \frac{\partial U}{\partial x} + \frac{\partial V}{\partial r} \frac{\partial U}{\partial x} + \frac{\partial V}{\partial \theta} \frac{\partial U}{\partial \theta} \right) \]

\[ + \frac{\partial \Omega}{\partial x} \left( r^2 \frac{\partial \Omega}{\partial x} \frac{\partial \Omega}{\partial x} + \frac{\partial \Omega}{\partial r} \frac{\partial \Omega}{\partial x} + \frac{\partial \Omega}{\partial \theta} \frac{\partial \Omega}{\partial x} \right) \]

\[ T_{37}^{xx} = -2r\Omega \frac{\partial V}{\partial x} + \partial V \left( \frac{\partial \Omega}{\partial x} \right)^2 \]

\[ T_{38}^{xx} = 0 \]

\[ T_{39}^{xx} = 0 \]

\[ T_{40}^{xx} = T_{36}^{xx} \]

\[ T_{41}^{xx} = T_{37}^{xx} \]

\[ T_{42}^{xx} = 0 \]
The terms in $T_{zz}$:

\[
T_{zz} = \frac{\partial U}{\partial x} \left( \frac{\partial V}{\partial x} \frac{\partial U}{\partial x} + \frac{\partial V}{\partial r} \frac{\partial U}{\partial x} + \frac{\partial V}{\partial \theta} \frac{\partial U}{\partial x} \right) + \frac{\partial V}{\partial r} \left( \frac{\partial V}{\partial x} \frac{\partial U}{\partial r} + \frac{\partial V}{\partial r} \frac{\partial U}{\partial r} + \frac{\partial V}{\partial \theta} \frac{\partial U}{\partial r} \right) \\

+ II_s \left( S_{33} - \frac{1}{3} r^2 \Theta \right) - I_s \left( S_{31}S_{13} + S_{32}S_{23} + \frac{1}{r^2} S_{33}S_{33} - \frac{1}{3} r^2 S^{(2)} \right) \]  
(C.34)

The scalars that appear in the above equations are as follows

\[ \Theta = S_{11} + S_{22} + \frac{1}{r^2} S_{33} \]  
(C.35)

\[ S^{(2)} = S_{11}S_{11} + S_{22}S_{22} + \frac{1}{r^4} S_{33}S_{33} + 2S_{13}S_{13} + \frac{2}{r^2} (S_{13}S_{13} + S_{23}S_{23}) \]  
(C.36)

\[ \Omega^{(2)} = 2\Omega_{12}\Omega_{21} + \frac{2}{r^2} (\Omega_{13}\Omega_{31} + \Omega_{23}\Omega_{32}) \]  
(C.37)

\[ \Omega S \Omega = \Omega_{12}\Omega_{21}(S_{11} + S_{22}) + \Omega_{12}\Omega_{31} \left( \frac{1}{r^2} (S_{23} + S_{33}) + \Omega_{21}\Omega_{32} \right) \left( S_{13} + S_{31} \right) \\
+ \frac{1}{r^2} \Omega_{31}\Omega_{23}(S_{12} + S_{21}) + \frac{1}{r^2} \Omega_{13}\Omega_{31} \left( S_{11} + \frac{1}{r^2} S_{33} \right) + \frac{1}{r^2} \Omega_{23}\Omega_{32} \left( S_{22} + \frac{1}{r^2} S_{33} \right) \]  
(C.38)

\[ I_s = \Theta , \quad II_s = \frac{1}{2} (\Theta^2 - S^{(2)}) \]  
(C.39)
Two other scalars \((S^*)^2\) and \((\Omega^*)^2\) can be expressed as

\[
(S^*)^2 = S^{(2)} - \frac{1}{3} \Theta^2, \quad (\Omega^*)^2 = \Omega^{(2)}
\]  

(C.40)

\[
W^* = \frac{1}{(S^*)^3} \left[ S_{11}^{\ast} \left( S_{12}^{\ast} S_{12}^{\ast} + S_{11}^{\ast} S_{11}^{\ast} + \frac{1}{r^2} S_{13}^{\ast} S_{13}^{\ast} \right)
+ S_{12}^{\ast} \left( S_{21}^{\ast} S_{12}^{\ast} + S_{22}^{\ast} S_{21}^{\ast} + \frac{1}{r^2} S_{23}^{\ast} S_{31}^{\ast} \right)
+ \frac{1}{r^2} S_{13}^{\ast} \left( S_{31}^{\ast} S_{11}^{\ast} + S_{32}^{\ast} S_{21}^{\ast} + \frac{1}{r^2} S_{33}^{\ast} S_{31}^{\ast} \right)
+ S_{21}^{\ast} \left( S_{11}^{\ast} S_{12}^{\ast} + S_{12}^{\ast} S_{22}^{\ast} + \frac{1}{r^2} S_{13}^{\ast} S_{32}^{\ast} \right)
+ S_{22}^{\ast} \left( S_{21}^{\ast} S_{12}^{\ast} + S_{22}^{\ast} S_{22}^{\ast} + \frac{1}{r^2} S_{23}^{\ast} S_{32}^{\ast} \right)
+ \frac{1}{r^2} S_{31}^{\ast} \left( S_{31}^{\ast} S_{12}^{\ast} + S_{32}^{\ast} S_{22}^{\ast} + \frac{1}{r^2} S_{33}^{\ast} S_{32}^{\ast} \right)
+ \frac{1}{r^2} S_{31}^{\ast} \left( S_{11}^{\ast} S_{13}^{\ast} + S_{12}^{\ast} S_{23}^{\ast} + \frac{1}{r^2} S_{13}^{\ast} S_{33}^{\ast} \right)
+ \frac{1}{r^2} S_{32}^{\ast} \left( S_{21}^{\ast} S_{13}^{\ast} + S_{22}^{\ast} S_{23}^{\ast} + \frac{1}{r^2} S_{23}^{\ast} S_{33}^{\ast} \right)
+ \frac{1}{r^4} S_{33}^{\ast} \left( S_{31}^{\ast} S_{13}^{\ast} + S_{32}^{\ast} S_{23}^{\ast} + \frac{1}{r^2} S_{33}^{\ast} S_{35}^{\ast} \right) \right]
\]  

(C.41)

where

\[
S_{11}^{\ast} = S_{11} - \frac{1}{3} \Theta, \quad S_{22}^{\ast} = S_{22} - \frac{1}{3} \Theta, \quad S_{33}^{\ast} = S_{33} - \frac{1}{3} r^2 \Theta,
S_{12}^{\ast} = S_{12}, \quad S_{13}^{\ast} = S_{13}, \quad S_{23}^{\ast} = S_{23}
\]  

(C.42)

Finally, the six components of \(S_{ij}\) and the three components of \(\Omega_{ij}\) (note that \(S_{ij} = S_{ji}\) and \(\Omega_{ij} = -\Omega_{ji}\)) are

\[
S_{11} = \frac{\partial U}{\partial x}, \quad S_{12} = \frac{1}{2} \left( \frac{\partial U}{\partial r} + \frac{\partial V}{\partial x} \right), \quad S_{13} = \frac{1}{2} \left( \frac{\partial U}{\partial \theta} + r^2 \frac{\partial \Omega}{\partial x} \right)
S_{22} = \frac{\partial V}{\partial r}, \quad S_{23} = \frac{1}{2} \left( \frac{\partial V}{\partial \theta} + r^2 \frac{\partial \Omega}{\partial r} \right), \quad S_{33} = r^2 \frac{\partial \Omega}{\partial \theta} + r V
\]

\[
\Omega_{12} = \frac{1}{2} \left( \frac{\partial U}{\partial r} - \frac{\partial V}{\partial x} \right), \quad \Omega_{13} = \frac{1}{2} \left( \frac{\partial U}{\partial \theta} - r^2 \frac{\partial \Omega}{\partial x} \right), \quad \Omega_{23} = \frac{1}{2} \left( \frac{\partial V}{\partial \theta} - \frac{\partial r^2 \Omega}{\partial r} \right)
\]  

(C.43)
Appendix: Equations for Axisymmetric Flows

Continuity equation

\[
\frac{\partial \rho}{\partial t} + \frac{\partial \rho U}{\partial x} + \frac{\partial \rho V}{\partial r} + \frac{\rho V}{r} = 0
\]

(D.1)

Momentum equations

\[
\frac{\partial \rho U}{\partial t} + \frac{\partial \rho U^2}{\partial x} + \frac{\partial p U V}{\partial r} + \frac{p V}{r} = -\frac{\partial \bar{P}}{\partial x} \\
+ \frac{\partial}{\partial x} \left[ 2(\mu + \mu_T) \left( \frac{\partial U}{\partial x} - \frac{1}{3} \Theta \right) \right] + \frac{\partial}{\partial r} \left[ (\mu + \mu_T) \left( \frac{\partial U}{\partial r} + \frac{\partial V}{\partial x} \right) \right] \\
+ \frac{1}{r} (\mu + \mu_T) \left( \frac{\partial U}{\partial r} + \frac{\partial V}{\partial x} \right) + \frac{\partial^2 \tau_{rr}}{\partial x^2} + \frac{\partial^2 \tau_{rr}}{\partial r^2} + \frac{1}{r} \tau_{rr}
\]

(D.2)

\[
\frac{\partial \rho V}{\partial t} + \frac{\partial \rho V^2}{\partial x} + \frac{\partial \rho U V}{\partial r} - \tau \partial^2 + \frac{\rho V^2}{r} = -\frac{\partial \bar{P}}{\partial r} \\
+ \frac{\partial}{\partial x} \left[ (\mu + \mu_T) \left( \frac{\partial V}{\partial x} + \frac{\partial U}{\partial r} \right) \right] + \frac{\partial}{\partial r} \left[ 2(\mu + \mu_T) \left( \frac{\partial V}{\partial r} - \frac{1}{3} \Theta \right) \right] \\

**Subject Terms:**
- Turbulent model; Swirling flows; Combustors

**Abstract:**
Aircraft engine combustors generally involve turbulent swirling flows in order to enhance fuel-air mixing and flame stabilization. It has long been recognized that eddy viscosity turbulence models are unable to appropriately model swirling flows. Therefore, it has been suggested that, for the modeling of these flows, a second order closure scheme should be considered because of its ability in the modeling of rotational and curvature effects. However, this scheme will require solution of many complicated second moment transport equations (six Reynolds stresses plus other scalar fluxes and variances), which is a difficult task for any CFD implementations. Also, this scheme will require a large amount of computer resources for a general combustor swirling flow. This report is devoted to the development of a cubic Reynolds stress-strain model for turbulent swirling flows, and was inspired by the work of Launder's group at UMIST. Using this type of model, one only needs to solve two turbulence equations, one for the turbulent kinetic energy $k$ and the other for the dissipation rate $\epsilon$. The cubic model developed in this report is based on a general Reynolds stress-strain relationship. Two flows have been chosen for model evaluation. One is a fully developed rotating pipe flow, and the other is a more complex flow with swirl and recirculation.
