Air Traffic and Operational Data on Selected U.S. Airports With Parallel Runways

Thomas M. Doyle
Adsystech, Inc., Hampton, Virginia

Frank G. McGee
Lockheed Martin Engineering & Sciences, Hampton, Virginia

May 1998
Acknowledgments

This document is the result of activities of the Airborne Information for Lateral Spacing (AILS) Ad Hoc Team on the role of ATC in the AILS process. The team members are Marvin Waller, Thomas Doyle and Frank McGee. Marvin Waller, team leader, has been involved in the AILS concept development for the last five years and provided the team with the background information related to AILS from the flight deck perspective. Tom Doyle, Adsystech, Inc., is a recently retired FAA Air Traffic Controller with extensive experience in ATC facility management. His most recent experience has been at the Dallas-Fort Worth TRACON and Tower as Manager of Operations. His involvement on the ad hoc team is jointly sponsored by NASA and the FAA. Frank McGee, Lockheed Martin, is a retired United States Navy Master Chief Air Traffic Controller. His background includes facility supervision and experience as an Air Traffic Control Safety Analyst conducting safety inspections at military installations worldwide. He was also Master Training Specialist responsible for Control Tower Operator certification. As well as bringing extensive ATC expertise to the team, Tom Doyle and Frank McGee used a number of contacts with individuals at ATC facilities throughout the country to assemble information on the details of current operations in various terminal areas.

Table 1: U.S. Airports With Parallel Runways .................................................................... 52
Introduction

This report presents information on a number of airports in the country with parallel runways and focuses on those that have at least one pair of parallel runways closer than 4300 ft. Information contained in the report describes the airport’s current operational activity as obtained through contact with the facility and from FAA air traffic tower activity data for FY 1997. The primary reason for this document is to provide a single source of information for research to determine airports where Airborne Information for Lateral Spacing (AILS) technology may be applicable.

A data sheet is presented for each airport. The data includes the quantity and type of activity at that airport and the resources to handle the activity, and shows the level of air traffic control (ATC) service provided. The level of ATC service at each airport may differ due to a variety of factors, such as the number of operations, runway configuration, and complexity of the surrounding airspace.

The two primary sources that provide ATC services to an airport are the terminal radar approach control facility (TRACON), and the airport traffic control tower. These facilities interface with each other for all aircraft operations in the terminal area. The tower is always located on the airport; however, the TRACON can be located at a site off the airport. The mission of these facilities is to provide a safe, efficient, and expeditious flow of air traffic to airports under their jurisdiction. Airports usually offer this service on a 24-hour-per-day basis in all weather conditions.

Instrument flight rules (IFR) and visual flight rules (VFR) are the basic rules used when providing ATC service. IFR conditions exist when weather conditions are below the minimum for flight under visual flight rules. During IFR conditions, an air traffic controller is responsible for providing prescribed separation between aircraft. VFR conditions exist at an airport when the reported ceiling is 1000 ft or higher, and the visibility is three statute miles or greater. Visual approaches are authorized to an airport when VFR conditions exist and may be used at the discretion of ATC. Under visual approach procedures, the flight deck crew is primarily responsible for maintaining separation from other aircraft. Consequently, separation between aircraft can be reduced and a greater airport flow rate is usually achieved. It is noteworthy that some terminal areas operate more efficiently using IFR procedures most of the time even when VFR procedures could be used. This type of operation is essentially due to the complexity of those areas and the need to have a more orderly flow of traffic. Most terminal areas operate more efficiently when they are able to use visual approach procedures. When employed, IFR procedures can have a delaying effect on the flow of traffic and the airport flow rate will be reduced.
The data sheet for each airport includes the following information:

1. **Airport**: Location, name, and three letter identifier.

2. **Hub airlines**: The airlines that use that airport as a hub.

3. **Airport average daily operations**: The overall average air traffic departures and arrivals for each day using FY 1997 data. This is not for the peak traffic day.

4. **Spacing between parallel runway centerlines**: The distance in feet between each set of parallel runways. When the distance is more than 4300 ft a plus sign (4300 ft +) is added.

5. **Type of radar system used at the airport**: Most airports use the ASR-9 radar with digitized radar data.

6. **Type and number of tower radar displays**: The Digital Brite Radar Indicator Tower Equipment (DBRITE) is used at most towers and is compatible with the ASR-9.

7. **Number of local control positions**: Tower positions that clear aircraft to land and takeoff and separate aircraft under their control.

8. **TRACON serving airport**: The radar approach control facility providing radar service for arriving and departing aircraft at that airport.
   - **TRACON arrival control positions**: Positions that provide sequencing and clearance for an instrument approach to the airport. They hand off aircraft on final approach to the tower local controller.
   - **TRACON final monitor positions**: During instrument meteorological conditions (IMC) they monitor precision instrument approaches to the runway to ensure a safe landing.

9. **Weather conditions below which instrument approaches are required**: A ceiling and/or visibility minimum where aircraft cannot see the airport or traffic to conduct a visual approach, and must use an instrument approach procedure.

10. **Usual or preferred flow of traffic**: The normal landing and departure configuration for that airport.

11. **Airport flow rate**: The number of arrivals the airport can safely and efficiently handle during an hour. The rates shown are for optimum visual conditions. As the weather deteriorates this rate will usually decrease.
12. **Arrival delay factors:** Delays normally occur due to weather affecting air traffic procedures and/or volume of traffic. Airports using two runways during visual meteorological conditions (VMC) may have to use only one runway during instrument meteorological conditions (IMC).

**Note:** For example, at times due to weather factors and capacity limitations at destination airports, flights will absorb delays on the ground before departure rather than by holding in flight. Related to this, when departure aircraft are not released from their gates because of delays then arriving aircraft inbound to their gates will be delayed.

13. **Remarks:** Any other data that may be a factor at that airport.

An airport diagram showing the overall airport configuration accompanies each data sheet. The airport diagrams are copied from the U.S. Government Flight Information Publication (Terminal), published by the National Imagery and Mapping Agency, September–November 1997.

Table 1 presents a list of U.S. airports with parallel runways 450 ft or more apart and is sorted by the lateral spacing between the runway centerlines.

This report is not intended to serve as an all inclusive authoritative document, but simply as a resource for the researcher. Airport operational characteristics continually evolve and any research should take this into account by insuring that the data being used is based on the most current information available.
Airport: Atlanta/William B. Hartsfield Atlanta International Airport (ATL)

Hub airlines: Delta and Atlantic Southeast

Airport average daily operations: 2123

Spacing between parallel runway centerlines:
- RWY 27R & 26L 4300 ft+
- RWY 26L & 26R 1000 ft
- RWY 27L & 27R 1000 ft

Type of radar system used at the airport: ASR-9

Type and number of tower radar displays: DBRITE 6

Number of local control positions: 4 Two local control arrivals and two local control departures. Will have five local control positions when RWY 10/28 is completed.

TRACON serving airport: Atlanta
- TRACON arrival control positions: 2
- TRACON final monitor positions: 2. Three with new runway.

Weather conditions below which instrument approaches are required: Ceiling 2900 ft and/or visibility 5 miles

Usual or preferred flow of traffic: Land on RWY26R & 27L Depart on RWY 27R & 26L
- Sixty percent west RWY 26L/R & RWY 26/R
- Forty percent east RWY 8L/R & RWY 9L/R

Airport flow rate: 96 per hour

Arrival delay factors: Volume of traffic and severe weather

Remarks: A new parallel runway (RWY 10/28) is being constructed that will give the airport the capability for triple simultaneous ILS approaches.
Landing aircraft can expect to remain on tower frequency until specifically instructed to contact ground control.

Caution: Be alert to runway crossing clearances. Readback of all runway holding instructions is required.

Ramp frequencies:
- Ramp 1 131.45
- Ramp 2 131.85
- Ramp 3 129.27
- Ramp 4 130.07
- Ramp 5 129.37
- Ramp 6 131.37

January 1995 annual rate of change 0.1°W

AIRPORT DIAGRAM
ATLANTA/THE WILLIAM B. HARTSFIELD ATLANTA INTL (ATL)
ATLANTA, GEORGIA
Airport: Boston/General Edward Lawrence Logan International Airport (BOS)

Hub airlines: Northwest

Airport average daily operations: 1354

Spacing between parallel runway centerlines:
- RWY 4L/R 1500 ft

Type of radar system used at the airport: ASR-9

Type and number of tower radar displays: DBRITE 3

Number of local control positions: 3

TRACON serving airport: Boston
- TRACON arrival control positions: 2
- TRACON final monitor positions: None

Weather conditions below which instrument approaches are required: Not a factor at this facility. Local procedures require instrument approaches.

Usual or preferred flow of traffic: Land and depart RWY 4L/R  Depart RWY 9

Airport flow rate: 50 per hour

Arrival delay factors: IFR weather

Remarks: Poor weather significantly reduces arrival capacity.
Airport: Dallas-Fort Worth International Airport (DFW)

Hub airlines: American

Airport average daily operations: 2538

Spacing between parallel runway centerlines:

- RWY 17C & 17L 5000 ft
- RWY 17C & 18R 5000 ft
- RWY 17C & 17R 1200 ft
- RWY 18L & 18R 1200 ft

Type of radar system used at the airport: 4 ASR-9s

Type and number of tower radar displays: DBRITE, 2 in East Tower and 2 in West Tower

Number of local control positions: 2 in East Tower and 2 in West Tower

TRACON serving airport: Dallas-Fort Worth

- TRACON arrival control positions: 2
- TRACON of final monitor positions: 2

Weather conditions below which instrument approaches are required: Ceiling 3000 ft and/or visibility 7 miles

Usual or preferred flow of traffic: RWY 17L/C/R and RWY 18L/R. Land on RWY 17L/C & RWY 18R and depart on RWY 17R & RWY 18L

Airport flow rate: 120 per hour

Arrival delay factors: Severe weather

Remarks: Three control towers. Triple parallel approaches are made to RWY 18R & RWY 17C/L.

READBACK OF ALL RUNWAY HOLDING INSTRUCTIONS IS REQUIRED.

JANUARY 1995 ANNUAL RATE OF CHANGE
0.1"W
Airport: Dallas-Love Field (DAL)

Hub airlines: Southwest

Airport average daily operations: 623

Spacing between parallel runway centerlines:
- RWY 13L/R 3000 ft

Type of radar system used at the airport: ASR-9 located at DFW

Type and number of tower radar displays: DBRITE 3

Number of local control positions: 2

TRACON serving airport: Dallas-Fort Worth
- TRACON arrival control positions: 1
- TRACON final monitor positions: None

Weather conditions below which instrument approaches are required: Ceiling 3000 ft and/or visibility 7 miles

Usual or preferred flow of traffic: Land and depart RWY 13L/R

Airport flow rate: 36 per hour set by DFW Traffic Management Unit

Arrival delay factors: None

Remarks: Tower has limited radar approach control (LRAC) capability. Large numbers of corporate aircraft based at airport.
**Airport:** Detroit Metropolitan Wayne County (DTW)

**Hub airlines:** Northwest

**Airport average daily operations:** 1486

**Spacing between parallel runway centerlines:**
- RWY 21L/R 4300 ft+
- RWY 27L/R 4300 ft+
- RWY 21R/C 3800 ft
- RWY 21L/C 2000 ft

**Type of radar system used at the airport:** ASR-9

**Type and number of tower radar displays:** DBRITE 4

**Number of local control positions:** 3

**TRACON serving airport:** Detroit
  - TRACON arrival control positions: 2
  - TRACON final monitor positions: 2

**Weather conditions below which instrument approaches are required:** Ceiling 4000 ft and/or visibility 8 miles

**Usual or preferred flow of traffic:** RWY 21. Land on RWY 21L/R, depart on RWY 21C

**Airport flow rate:** 90 per hour

**Arrival delay factors:** None

**Remarks:** RWY 4/22, is planned for completion in year 2001. Located west of RWY 3L/21R, this will permit triple parallel approaches.
Airport: Fort Lauderdale-Hollywood International Airport (FLL)

Hub airlines: None

Airport average daily operations: 674

Spacing between parallel runway centerlines:
- RWY 9L/R 4000 ft

Type of radar system used at the airport: ASR-9

Type and number of tower radar displays: DBRITE 3

Number of local control positions: 2

TRACON serving airport: Miami
- TRACON arrival control positions: 1
- TRACON final monitor positions: None

Weather conditions below which instrument approaches are required: Ceiling 3000 ft and/or visibility 5 miles

Usual or preferred flow of traffic: Land and depart RWY 9L/R

Airport flow rate: None

Arrival delay factors: None

Remarks:
Airport: Houston/George Bush Intercontinental Airport (IAH)

Hub airlines: Continental

Airport average daily operations: 1124

Spacing between parallel runway centerlines:

- RWY 26 & 27 4300 ft+
- RWY 14L/R 1000 ft

Type of radar system used at the airport: 2 ASR-9s

Type and number of tower radar displays: DBRITE 4

Number of local control positions: 3

TRACON serving airport: Houston

- TRACON arrival control positions: 3
- TRACON final monitor positions: 2

Weather conditions below which instrument approaches are required: ILS approaches are in use at all times

Usual or preferred flow of traffic: Land RWY 26 and 27, depart RWY 14L/R

Airport flow rate: 72 per hour

Arrival delay factors: Severe weather

Remarks: RWY 8L/26R is planned for completion in year 2002. Located parallel and north of the existing RWY 8/26, this will permit triple simultaneous ILS approaches.
**Airport:** Indianapolis International Airport (IND)

**Hub airlines:** None

**Airport average daily operations:** 591

**Spacing between parallel runway centerlines:**

- RWY 23L/R 4300 ft+

**Type of radar system used at the airport:** ASR-9

**Type and number of tower radar displays:** DBRITE 2

**Number of local control positions:** 2

**TRACON serving airport:** Indianapolis

- TRACON arrival control positions: 2
- TRACON final monitor positions: None

- Capability for simultaneous approaches starting the summer of 1998, will require two final monitors. One horizontal display for two final monitors has already been installed.

**Weather conditions below which instrument approaches are required:** Ceiling 3000 ft and/or visibility 5 miles

**Usual or preferred flow of traffic:** RWY 23L/R. At night from 2200 to 0600, land RWY 5 and depart RWY 23

**Airport flow rate:** 70 per hour

**Arrival delay factors:** None

**Remarks:** Federal Express and U.S. Postal Service conduct night operations. Each have their own terminal and hangar.

January 1995 Annual Rate of Change 0.1"W

Rwys 51-23R, 5R-23L and 14-32
S145, T300, T1550
Airport: Las Vegas/McCarran International Airport (LAS)

Hub airlines: America West and Southwest

Airport average daily operations: 1302

Spacing between parallel runway centerlines:
- RWY 25L/R 1000 ft

Type of radar system used at the airport: ASR-9

Type and number of tower radar displays: DBRITE 2

Number of local control positions: 2

TRACON serving airport: Las Vegas

- TRACON arrival control positions: 2
- TRACON final monitor positions: None

Weather conditions below which instrument approaches are required: Low ceilings on rare occasions

Usual or preferred flow of traffic:
- Arrivals RWY 25L
- Departures RWY 25R
- Business and general aviation aircraft use RWY 19L/R

Airport flow rate: 60 per hour

Arrival delay factors: None

Remarks: Mountains are located six to ten miles to the west. Southwest Airlines expects 60 additional operations when new gates open June 1998.
Airport: Los Angeles International Airport (LAX)

Hub airlines: United, TWA, and Continental

Airport average daily operations: 2101

Spacing between parallel runway centerlines:
- RWY 25R/24L 4300 ft+
- RWY 25L/R 700 ft
- RWY 24L/R 700 ft

Type of radar system used at the airport: ASR-9

Type and number of tower radar displays: DBRITE 5

Number of local control positions: 2

TRACON serving airport: Southern California (SCT)
- TRACON arrival control positions: 2
- TRACON final monitor positions: 2

Weather conditions below which instrument approaches are required: Ceiling 5000 ft and/or visibility 8 miles

Usual or preferred flow of traffic: RWY 24 and RWY 25

Airport flow rate: 84 per hour

Arrival delay factors: Volume of traffic

Remarks: When RWYs 24 and 25 are in use, all aircraft inbound from the east are sequenced to make ILS approaches.
Airport: Memphis International Airport (MEM)

Hub airlines: Northwest

Airport average daily operations: 1003

Spacing between parallel runway centerlines:

- RWY 36L & 36C 3400 ft
- RWY 36C & 36R 926 ft

Type of radar system used at the airport: ASR-9

Type and number of tower radar displays: DBRITE 3

Number of local control positions: 3

TRACON serving airport: Memphis

- TRACON arrival control positions: 3
- TRACON final monitor positions: 2

Weather conditions below which instrument approaches are required: Ceiling 5000 ft and/or visibility 5 miles

Usual or preferred flow of traffic: RWY 36L/C/R. Federal Express uses RWY 27 for night operations

Airport flow rate: 80 per hour

Arrival delay factors: None

Remarks: Busy after midnight due to Federal Express operations.
Airport: Minneapolis-St. Paul International Airport (MSP)

Hub airlines: Northwest

Airport average daily operations: 1338

Spacing between parallel runway centerlines:
- RWY 30L/R 3380 ft

Type of radar system used at the airport: ASR-9

Type and number of tower radar displays: DBRITE 3

Number of local control positions: 2

TRACON serving airport: Minneapolis

- TRACON arrival control positions: 2
- Final monitor positions: 2 precision runway monitors (PRM)

Weather conditions below which instrument approaches are required: Ceiling 3200 ft and/or visibility 8 miles

Usual or preferred flow of traffic: Simultaneous parallel approaches to RWY 30L/R

Airport flow rate: 60 per hour

Arrival delay factors: None

Remarks: ILS PRM approaches approved. RWY 17/35 is planned for completion in year 2003, and will be used primarily as a departure runway.
Airport: New York/John F. Kennedy International Airport (JFK)

Hub airlines: US Airways, Delta, TWA, American, and United

Airport average daily operations: 992

Spacing between parallel runway centerlines:
• RWY 31L/R 4300 ft+
• RWY 4L/R 3000 ft

Type of radar system used at the airport: ASR-9

Type and number of tower radar displays: DBRITE 3

Number of local control positions: 2

TRACON serving airport: New York

• TRACON arrival control positions: 2

• TRACON final monitor positions: 2. Used for approaches to RWY 31L/R only

Weather conditions below which instrument approaches are required: Ceiling 3000 ft and/or visibility 7 miles

Usual or preferred flow of traffic: RWY 31L/R

Airport flow rate: 50 per hour

Arrival delay factors: IFR weather

Remarks: Very busy area with many airspace constraints. John F. Kennedy, Newark, and LaGuardia airports are all within 20 miles of each other.
CAUTION: BE ALERT TO RUNWAY CROSSING CLEARANCES. READBACK OF ALL RUNWAY HOLDING INSTRUCTIONS IS REQUIRED.
Airport: Oakland/Metropolitan Oakland International Airport (OAK)

Hub airlines: Southwest

Airport average daily operations: 1338

Spacing between parallel runway centerlines:
- RWY 27L/R 1000 ft

Type of radar system used at the airport: ASR-9

Type and number of tower radar displays: DBRITES 4

Number of local control positions: 3

TRACON serving airport: Bay TRACON
- TRACON arrival control positions: 3
- TRACON final monitor positions: None

Weather conditions below which instrument approaches are required: Ceiling 4000 ft and/or visibility 8 miles

Usual or preferred flow of traffic: RWY 27L/R and RWY 29

Airport flow rate: 35 per hour

Arrival delay factors: Severe weather and volume of traffic

Remarks: Airspace constraints caused by proximity to San Francisco and San Jose Airports.

AIRPORT DIAGRAM

ORLANDO, FLORIDA

ORLANDO INTL (MCO)
Airport: Philadelphia International Airport (PHL)

Hub airlines: US Airways

Airport average daily operations: 1258

Spacing between parallel runway centerlines:

- RWY 27L/R 1400 ft

Type of radar system used at the airport: ASR-9 and ASR-8

Type and number of tower radar displays: DBRITE 2

Number of local control positions: 2

TRACON serving airport: Philadelphia

- TRACON arrival control positions: 2
- TRACON final monitor positions: 2

Weather conditions below which instrument approaches are required: Ceiling 2500 ft and/or visibility 8 miles

Usual or preferred flow of traffic: RWY 27L/R

Airport flow rate: 50 per hour

Arrival delay factors: IFR weather

Airport: Phoenix Sky Harbor International Airport (PHX)

Hub airlines: Southwest and America West

Airport average daily operations: 1468

Spacing between parallel runway centerlines:
- RWY 26L/R 3565 ft

Type of radar system used at the airport: ASR-9

Type and number of tower radar displays: DBRITE 2

Number of local control positions: 2

TRACON serving airport: Phoenix

- TRACON arrival control positions: 2
- TRACON final monitor positions: None

Weather conditions below which instrument approaches are required: VFR conditions majority of the time

Usual or preferred flow of traffic: RWY 26L/R

Airport flow rate: 60 per hour

Arrival delay factors: None

Remarks: RWY 7/25 is planned for completion in mid-1999. Located parallel and south of the existing RWY 8R/26L, this will permit dual simultaneous ILS approaches.
Airport: Pittsburgh International Airport (PIT)

Hub airlines: US Airways

Airport average daily operations: 1256

Spacing between parallel runway centerlines:
• RWY 28R/C 4300 ft
• RWY 28C/L 1200 ft

Type of radar system used at the airport: ASR-9

Type and number of tower radar displays: DBRITE 3

Number of local control positions: 3

TRACON serving airport: Pittsburgh
• TRACON arrival control positions: 2
• TRACON final monitor positions: 2

Weather conditions below which instrument approaches are required: Ceiling 3000 ft and/or visibility 8 miles

Usual or preferred flow of traffic: RWY 28L/C/R. Land on RWY 28L/R and depart on RWY 28C

Airport flow rate: 87 per hour

Arrival delay factors: None

Remarks:
Airport: Portland International Airport (PDX)

Hub airlines: None

Airport average daily operations: 897

Spacing between parallel runway centerlines:

- RWY 10L/R 3100 ft

Type of radar system used at the airport: ASR-9

Type and number of tower radar displays: DBRITE 2

Number of local control positions: 1

TRACON serving airport: Portland

- TRACON arrival control positions: 3
- TRACON final monitor positions: None

Weather conditions below which instrument approaches are required: Ceiling 3000 ft and/or visibility 7 miles

Usual or preferred flow of traffic: RWY 10L/R during fall and winter. RWY 28L/R during spring and summer

Airport flow rate: 50 per hour

Arrival delay factors: IFR weather

Remarks:
Airport: Raleigh-Durham International Airport (RDU)

Hub airlines: Midway and US Airways

Airport average daily operations: 661

Spacing between parallel runway centerlines:
- RWY 23L/R 3400 ft

Type of radar system used at the airport: ASR-9

Type and number of tower radar displays: DBRITE 2

Number of local control positions: 2

TRACON serving airport: Raleigh

- TRACON arrival control positions: 2
- TRACON final monitor positions: None

Weather conditions below which instrument approaches are required: Ceiling 4000 ft and/or visibility 8 miles

Usual or preferred flow of traffic: RWY 23L/R

Airport flow rate: None

Arrival delay factors: IFR weather

Remarks: RWY 5/23 is planned for completion in year 2005. Located parallel and west of RWY 5L/23R, this will permit dual simultaneous ILS approaches.
Airport: Salt Lake City International Airport (SLC)

Hub airlines: Delta and Continental

Airport average daily operations: 1025

Spacing between parallel runway centerlines:

- RWY 16L/R 4300 ft+

Type of radar system used at the airport: ASR-9

Type and number of tower radar displays: DBRITE 3

Number of local control positions: 3

TRACON serving airport: Salt Lake

- TRACON arrival control positions: 3
- TRACON final monitor positions: 2

Weather conditions below which instrument approaches are required: Ceiling 6000 ft and/or visibility 5 miles

Usual or preferred flow of traffic: RWY 16L/R

Airport flow rate: 60 per hour

Arrival delay factors: Severe weather

Remarks: Mountainous terrain in proximity constrains traffic flow. Can only run downwind on west side of airport.

CAUTION: BE ALERT TO RUNWAY CROSSING CLEARANCES.
READBACK OF ALL RUNWAY HOLDING INSTRUCTIONS IS REQUIRED.
**Airport:** San Francisco International Airport (SFO)

**Hub airlines:** United

**Airport average daily operations:** 1224

**Spacing between parallel runway centerlines:**
- RWY 28L/R 750 ft
- RWY 1L/R 750 ft

**Type of radar system used at the airport:** ASR-9

**Type and number of tower radar displays:** DBRITE 4

**Number of local control positions:** 1

**TRACON serving airport:** Bay TRACON

- TRACON arrival control positions: 2
- TRACON final monitor positions: None

**Weather conditions below which instrument approaches are required:** Ceiling 5000 ft and/or visibility 7 miles

**Usual or preferred flow of traffic:** Land RWY 28L/R and depart RWY 1L/R

**Airport flow rate:** 60 per hour

**Arrival delay factors:** IFR weather and volume of traffic

**Remarks:** Aircraft on final approach for RWY 28L/R require additional spacing to allow departures on crossing parallel runways (RWY 1L/R). This has a significant impact on traffic flow management and tower procedures.
NOTE: Several runway hold position signs are on the right rather than the left side of taxiways.

CAUTION: BE ALERT TO RUNWAY CROSSING CLEARANCES. READBACK OF ALL RUNWAY HOLDING INSTRUCTIONS IS REQUIRED.
Airport: Seattle-Tacoma International Airport (SEA)

Hub airlines: Alaska and United

Airport average daily operations: 1043

Spacing between parallel runway centerlines:
- RWY 16L/R 800 ft

Type of radar system used at the airport: ASR-9

Type and number of tower radar displays: DBRITE 2

Number of local control positions: 1

TRACON serving airport: Seattle
- TRACON arrival control positions: 1
- TRACON final monitor positions: 2 running approaches to Boeing field during IMC

Weather conditions below which instrument approaches are required: Ceiling 3100 ft and/or visibility 4 miles

Usual or preferred flow of traffic: RWY 16L/R

Airport flow rate: 48 per hour

Arrival delay factors: None

Remarks: Boeing field located 4 miles north. A new parallel runway is being planned west of RWY 16R and will be operational in 2001. Runway centerlines between the new runway and RWY 16L will be 2500 ft.

Airport: St. Louis-Lambert International Airport (STL)

Hub airlines: TWA

Airport average daily operations: 1413

Spacing between parallel runway centerlines:
- RWY 30L/R 1300 ft

Type of radar system used at the airport: ASR-9

Type and number of tower radar displays: DBRITE 2

Number of local control positions: 3

TRACON serving airport: St. Louis
- TRACON arrival control positions: 2
- TRACON final monitor positions: 2

Weather conditions below which instrument approaches are required: Ceiling 5000 ft and/or visibility 5 miles

Usual or preferred flow of traffic: Land RWY 30L/R and RWY 24 and depart RWY 30L/R

Airport flow rate: 72 per hour

Arrival delay factors: IFR weather and volume of traffic

Remarks: Dependent converging ILS RWY 24 and 30R approaches authorized. Localizer Type Directional Aid approaches authorized to RWY 30L and RWY 12L. No heavy jets on Localizer Type Directional Aid approaches or to RWY 24.

This report presents information on a number of airports in the country with parallel runways and focuses on those that have at least one pair of parallel runways closer than 4300 ft. Information contained in the report describes the airport's current operational activity as obtained through contact with the facility and from FAA air traffic tower activity data for FY 1997. The primary reason for this document is to provide a single source of information for research to determine airports where Airborne Information for Lateral Spacing (AILS) technology may be applicable.
