Internet over a Bi-Directional Satellite Link

Jim Griner
Mark Allman
Paul Mallasch
David Stewart

Satellite Networks: Architectures, Applications, and Technologies Workshop
June 2-4, 1998

Internet over a Bi-Directional Satellite Link

- Comparison of HTTP over several network channels
  - 33.6k modem connection
  - Satellite connection, standard TCP stack and typical application settings
  - Satellite connection, optimized for satellite networks
    - larger window sizes
    - larger initial congestion window
    - TCP bug fixes
    - new versions of the HTTP protocol
- By using appropriately tuned applications and TCP settings, we demonstrate improved performance of HTTP when compared to today's off-the-shelf software

Optimizations are based upon findings from experiments conducted between satellite research networks at NASA Lewis Research Center and Ohio University.
Internet over a Bi-Directional Satellite Link

Demonstration Setup

- Path 1: Modem
- Path 2: Satellite, typical settings
- Path 3: Satellite, optimized

Sheraton Airport Hotel

NASA LeRC

Internet over a Bi-Directional Satellite Link

- HTTP Comparison Pages
  - 20 pages gathered from several Ohio related sites
  - Pages with varying attributes
    - Number of images from 1 to 27
    - Image sizes from 177 bytes to 360 kilobytes

- Demonstration setup in Dulles
  - Three computers, one for each of the network channels
  - Pages are synchronized to start at the same time
  - The computers will pause for one minute, before moving on to the next page
  - The 20 pages will repeat continuously, for the duration of the workshop
