VII. Revised budget
VIII. Curriculum Vitae: Kevin Griffin

I. Introduction

Through the support of NASA's Mission to Planet Earth, Biosphere 2 Center hosted 11 research interns for 6 to 8 weeks each during the summer of 1997. In addition, we were able to offer scholarships to 14 students for Columbia University summer field courses. These two types of programs engaged students in much of the range of activity of practicing Earth Scientists, with an emphasis on the collection and analysis of data in both the field and the laboratory. Research interns and students in the field courses also played an important part in the design and evolution of their research projects. In addition to laboratory and field research, students participated in weekly research seminars by resident and visiting scientists. Research interns were exposed to the geology and ecology of the region via short field trips to the Arizona Sonora Desert Museum, Mount Lemmon, Aravaipa Canyon and the Gulf of California, while field course students were exposed to laboratory-based research via intern-led hands-on demonstrations of their work. All students made oral and written presentations of their work during the summer, and two of the research interns have applied to present their results at the National Conference on Undergraduate Research in Maryland in April, 1998.

II. Summer 1997 Student Profiles

Research Interns:

Research interns spent 6 to 8 weeks on their projects, receiving a stipend, housing and support for field excursions from the NASA grant. Both individual and team research projects were assigned. Research interns were chosen by a number of criteria, including the following:

1. Demonstrated interest and ability in science (evaluated via letter of interest, letter or phone reference, and transcript)
2. Likelihood that research experience would advance their career goals (evaluated by letter of interest, resume and letter or phone reference)
3. Desire to provide research experience for students of high ability with little access to research at their home institutions
4. Desire to increase participation by underrepresented groups in Earth System Science education and research.

Of the twelve research interns, 3 were African-American, 1 was Hispanic-American, 2 were Asian-American and 7 were women.
The following students were interns during the summer of 1997:

Debbie Brewer is a biology major at Arizona State University, with plans for a career in ecology and biodiversity research (GPA, 3.34). Her statement of interest and strong letter of reference indicated that she would benefit greatly from the opportunity to pursue independent research, and had the maturity, intellgence and motivation to excel in a research environment. Debbie completed a project on the effects of calcification on photosynthesis and nutrient uptake in marine algae.

Koben Christianson is an environmental policy major at Colorado College (GPA 3.5) who is committed to creating sound environmental policy via thorough understanding of the underlying natural science, as well as social, economic and political factors. The world is his classroom, and he has spent previous semesters in Nairobi at the American University International Environment and Development Program, in the Sea Semester at Woods Hole, doing policy research in Costa Rica, and in the Earth Semester at Biosphere 2 Center. Koben completed a project analyzing the educational role for complex systems theory in helping to integrate the teaching of physical, biological and social sciences.

Adam Cianton is a double-major in environmental studies and political science at Brown University (GPA 3.4). He had previous internship experience in politics, and community service, and expressed a strong interest in personally helping to bridge the gap between scientists and policy-makers. He felt that he could best do this with some experience in hands-on research, and we agreed with him. Adam completed a project documenting gradients in light, water and soil characteristics in the agricultural biome of Biosphere 2.

Kelven Goodridge is a biology major at Morehouse College (GPA 2.6) and previous research experience in behavioral toxicology. He felt that this research experience would help him to decide among various disciplinary paths within environmental science, and had not had much exposure to the physical aspects of environmental science previously. Kelven completed a project on methane sources and sinks from the various biomes inside Biosphere 2.

Leone McCreary is an environmental science major at Barnard College (GPA 3.83). She intends to pursue a career in environmental research on her home island, St. Croix, USVI. Her participation in the Spring 1997 Earth Semester at Biosphere 2 revealed that Leone has truly outstanding capabilities in both research and leadership skills. She completed an analysis of the Biosphere 2 biotic database, making strong recommendations for improvements.

Jennifer Molnar is an environmental engineering major at Harvard University (GPA 3.2). She plans to devote her career to improving the environment through scientific problem solving. She had former experience in environmental assessment and field studies, but little experience in scientific research. Jennifer completed a project on methane sources and sinks from the various biomes inside Biosphere 2, and plans to present her results at the National Conference on Undergraduate Research.

Megan Rathfon is a biology major at Wellesley College (GPA 3.35), who has a strong background in field studies and community service, who wished to gain experience with focused scientific research. She hopes to teach environmental science in the future. She completed a project on the effects of calcification on photosynthesis and nutrient uptake in marine algae.

Debika Shome is an environmental science major from Barnard College (GPA 3.25). She is one of two students who completed both a summer field course and a research internship at Biosphere 2. She expressed the hope that her summer experience would help her choose between careers in environmental research or management. Debika completed a project on sources of copper in the Biosphere 2 ocean.
Kendra Stamps is a biology major at Mississippi Valley State University (GPA 3.36). She had strong recommendations from professors, as well as a stated desire to broaden her research experience to include more environmental science. Unfortunately, Kendra had to withdraw from the program after one week due to a family emergency.

Motofumi Tohda is an environmental studies and chemistry double-major at Oberlin College (GPA 3.76). He hopes to apply his education to a career in bioremediation, and was eager for this first opportunity for focused research. Motofumi completed a project on light, temperature and nutrient distributions in the Biosphere 2 rainforest.

Paul Wigton is a geology major at the University of Colorado (GPA 3.14) with a passion for designing and engineering solutions to environmental problems. Paul was an excellent fit to a project to design open-topped growth chambers with controlled-CO2. He was one of two students who attended a field program and completed a research project.

Veronica Vieira is a major in environmental engineering at the Massachusetts Institute of Technology, GPA (4.5/5). She demonstrated strong interest and ability in paleoceanography research on a research project at MIT, and expressed specific interest in working directly with some of the organisms used as paleoceanographic proxies. She completed a project on the effects of pCO2 on isotopic signals in marine algae.

Field Scholars:

Field scholars attended one of the two field courses described below. They received need-based scholarships of up to $1000 from the NASA MTPE grant, which allowed them to supplement their classroom work with practical and perspective-changing field experience. As a whole, they did very well in the courses. Of 14 field scholars, none were African American, none were Hispanic American, one was Asian-American and 8 were women.

III. Plans for program enhancement

After reviewing evaluations from students and mentors, the following changes will be implemented for the 1998 and 1999 intern programs:

*Improve the diversity and equity of opportunity for interns and field school students:* We had very little time to recruit interns last summer, due to the late notification of the grant award. With more time this year, we will be able to improve our outreach to community college and minority students for both the intern program and field school.

*Increase length of internships:* The original length of 6 weeks was chosen to allow students to avail themselves of both a field program and research experience during the summer. Our first summer experience taught us that the 12-week commitment is too long for most. Both students and mentors felt that 6 weeks was not enough time to gain sufficient mastery of a subject and complete a project. Future internships will be 10 weeks, giving students time for a more satisfactory research experience.

*Hire a Resident Assistant:* The proposed budget has been amended to include funding for a resident assistant to provide scheduled transportation for those without cars, and to provide a first level of guidance and counseling when problems arise. The RA will also help to organize day trips for interns. The RA will be trained by the Director of Student Affairs. He/she will be a graduate student doing research at Biosphere 2 during the summer.

*Improve laboratory facilities:* All equipment and labs on site have been upgraded over the past year to best serve the current research program.

*Provide more opportunity for student-intern interaction:* We plan to run joint orientation activities for students and interns, encourage interns to attend selected field school lectures on topics of general interest, increase the time available for intern-led tours of their research in the Biosphere and in their laboratories, arrange the field school schedule so that students can attend research and intern lectures, house interns and students in close proximity, and include interns in all student-life activities.

*Revise format of weekly mentor-intern lunches:* In 1997 we had weekly lunches for interns and mentors in which interns were to give a five-minute update on progress on their project. Student interns felt that these were not very useful or interesting, as they tended to talk about their research outside of this brown-bag format anyway. As an alternative, interns will be asked to lead discussion of a paper from the scientific literature related to research activities at Biosphere 2. Interns will work in teams of two, and can consult their mentors for suggested papers.

*Increase number of research seminars:* We plan to increase the number of lectures from one to two per week by re-directing some of the NASA funding toward honoraria for outside lecturers, and by inviting interns to specific field school lectures. We will also arrange for video-link of four lectures between Biosphere 2 and Lamont-Doherty Earth Observatory, so that interns in each place can be introduced to research at the other.

*Improve housing facilities:* Intern housing last summer was very crowded and cooking facilities were limited. In future summers, interns will be housed in new dormitories installed in the fall of '97. Ten interns will reside with an RA in a large 6-bedroom house with living, cooking and dining areas. This house is located adjacent to field student housing.
IV. Summer 1998 Research Projects:

**Intertidal Zonation in the Sea of Cortez:** Richard Brusca, Ann Holmes
The intertidal region of the Sea of Cortez (=Gulf of California) is known to be one of the richest and most diverse marine habitats on Earth. However, virtually nothing is known of how the animals and plants share this highly diverse, but poorly explored area. Students involved in this project would work under the direction of Dr. Richard C. Brusca and Dr. Ann Holmes (at Biosphere 2 Center) and Peggy Turk-Boyer (Director of CEDO, Puerto Peñasco, Mexico) to investigate aspects of intertidal zonation in on a rocky shore in the northern Sea of Cortez. The goal would be to develop the first detailed description of Intertidal zonation for this region. The project would require laboratory and library work at the Biosphere 2 Center and CEDO, as well as several 4-5 day field trips to the Sea of Cortez. Scuba diving is not necessary, as the tides in the northern Gulf of California are extreme and allow sufficient exposure during new and full moon periods.

**Zoological Inventory of the Ocean Biome at Biosphere 2 Center:** Richard Brusca, Heidi West
The Ocean Biome was originally seeded with organisms from two source areas, the Caribbean and the Sea of Cortez. Although initial records were maintained, the Ocean Biome has not been fully censused to see what species have survived since closure, nor to discover what incidental species of small invertebrates might have been introduced along with the larger coral and algal species. This project would require scuba diving and snorkeling in the Ocean Biome to non-destructively sample and census its biodiversity. It would also require considerable identification work, using microscopes and library materials. The goal would be to produce a new, complete census of the Ocean Biome's biodiversity, including species lists and estimates of population sizes.

**CO$_2$ and H$_2$O exchange in desert and rainforest ecosystems:** Guang-hui Lin
Many basic questions about the functioning of terrestrial ecosystems can be addressed with stable isotope studies. The key question we will try to address this summer is how changes in precipitation affect the functioning of both moist and arid ecosystems. We will study CO$_2$/H$_2$O fluxes and associated isotopic exchanges inside the rainforest of Biosphere 2 as well as on desert ecosystems (Sacaton meadow and Mesquite forest) of the San Pedro River Basin (about 2 hrs drive from B2C). Common ecophysiological instruments (e.g. LI-COR photosynthesis and soil respiration systems) and stable isotope techniques will be used during the study. Interns who participate in the project will have opportunities to get training on applications of these technologies to ecological/environmental research and will work in both humid and dry climates.

**Environmental controls on methane concentrations in Biosphere 2:** Debra Colodner, William Reeburgh (UC Irvine), Joost van Haren
Methane is an important greenhouse gas which has been increasing in our atmosphere due to a variety of human activities. The Biosphere 2 facility offers the opportunity to study the interaction of atmospheric methane sources and sinks with other environmental parameters, such as temperature, moisture and atmospheric CO$_2$. One can study these interactions on the unique scale of Biosphere 2 - somewhere between a growth chamber and a real ecosystem. Controls, sensors and frequent sampling allow response mechanisms to be explored and quantified. Students will gain experience with environmental trace gas sampling and gas chromatography, as well as the biogeochemistry of methane.

**Interpreting Earth Systems Research for the Public:** Debra Colodner, Alexis Faust
Biosphere 2 Center is visited by almost 200,000 people every year, and has the opportunity to reach even more people through our web site. Working with our public programs staff, this project will involve creating web pages, hand-outs, and interpretive materials for tour guides that will explain the research of the Biosphere interns and students to the public.

The effects of increased atmospheric CO2 on coral reefs: Chris Langdon
One of the factors affecting the declining health of coral reefs around the globe may be increasing atmospheric CO2. This project utilizes the coral population of the Biosphere 2 ocean to study the effects of elevated atmospheric CO2 on coral reef community metabolism. Students can chose to look at either the changes in community photosynthesis in response to higher dissolved CO2, or the change in community calcification in response to decreased carbonate saturation state.

The construction of leaves: Kevin Griffin
The construction cost of leaves (energy required to form new leaf material) is sensitive to leaf age, leaf type and environmental resource availability. This project will take advantage of wide rage of species (consisting of many different physiologies, chemistries, functional types and natural histories), growing inside the Biosphere 2 wilderness area to perform a survey of leaf construction cost as it compares to leaf age and physiology. Laboratory techniques for measuring leaf construction cost will be combined with "field" measurements of leaf expansion and age, leaf gas-exchange and environment. Another part of the project will look at leaf ultra structure, which is sensitive to leaf age, leaf type and environmental resource availability. Electron microscope techniques for looking at leaf ultra structure will be combined with "field" measurements of leaf expansion and age, leaf gas-exchange and environment. This project will require travel to Lamont-Doherty earth observatory in NY for the electron microscope analysis.

Plant responses to variable CO2 concentrations: Kevin Griffin, Blake Farnsworth
This research focuses on an evaluation of the biological impact of an unique feature of Biosphere 2: the diurnal cycling of the CO2 partial pressure of its atmosphere. The central question is whether or not the predictably variable CO2 environment of Biosphere 2 creates substantial difficulties in understanding the responses of plants, from the level of genes to ecosystems, to elevated atmospheric CO2. Physiological, biochemical and molecular measurements of the photosynthetic and respiratory characteristics of plants within open-top chambers will be analyzed over time in order to identify the effects of elevated and variable CO2 partial pressure at a variety of biological scales.

The effect of elevated CO2 on forested ecosystems: Kevin Griffin
This project is an experimental evaluation of the Biosphere 2 IAB for long-term experiments on carbon, water and nitrogen fluxes in forested ecosystems. An Eastern Cottonwood plantation will be established in the IAB. Baseline data will be collected to quantify the plant growth and physiology under ambient and elevated CO2 concentrations. The results of leaf level measurements will be compared to system level responses.

In addition to the projects listed above, we will have 6-8 new research collaborators from the University of Arizona by this summer, and expect that many of them will want to supervise an intern.
V. Field course descriptions

NASA-funded Field Scholars participated in one of the two field courses (6 in session 1 and 8 in session 2). Descriptions of these courses are listed below.

*Earth Systems Field School, Session 1: Field Course in Earth Systems*

This six-week summer field course is designed to equip students with practical and state-of-the-art experience in the use of field techniques that address a broad range of Earth system, environmental, and research problems. The course was designed especially for students of Earth System Science, and stresses the connections between the various Earth “spheres” (geo-, bio-, atmo-, and hydro-). Students learn to assess various sites in an integrated fashion, including biological, geological, geochemical and geophysical techniques. The unique Biosphere 2 global change research facility, together with the incomparable environmental resources within a day’s drive of campus (the Grand Canyon, Meteor Crater, Gulf of California, archaeological sites, the Sonoran Desert), give students a view of methods used to understand past, present, and future Earth system problems.

**Week 1: Introduction and Orientation**
The first week of the course is devoted to field methods, as well as developing basic computer and statistical skills. During this week, students get an introduction to various field and computer techniques, organism and rock identification, arid ecosystems and the special issues of sky islands, map-reading and orienteering skills, Biosphere 2, including a tour and safety walk and to the geology of Arizona. In addition, they review basic Earth System concepts.

**Week 2: Northern Arizona trip: Deep time processes**
The second week is devoted to a trip around Northern Arizona to focus on Earth History as revealed in the landscape. Students visit the Salt River Canyon to study and sketch the stratigraphic section, as well as get an introduction to water management issues in Arizona. They stop at Meteor Crater to discuss evolution and mass extinctions. A trip to Sunset Crater focuses them on the important roles of volcanoes in the Earth System, over various time scales. Along the way, stops at archaeological sites are used to illustrate the changing relationship between humans and the environment through time. Students finally visit the Grand Canyon and describe the stratigraphic section as well as the biological gradients they find on a walk part-way down and up.

**Weeks 3, 4: Systems analysis in the field**
Students are introduced to mapping using Electronic Total Stations and Geographic Information Systems by producing a base map for one of the biomes of Biosphere 2. They create a layered geological and vegetation map of the field site in the Catalina mountains. Geophysical techniques are introduced so that students can include features of the sub-surface as well. During week 3, student teams design a research project for the site to be carried out during the following week. In addition to collecting data during week 4, students receive additional instruction in class and on field trips about ecological, climatological and hydrological gradients, biogeochemical cycles, and soil characteristics and processes. They use the information they collect in the field as well as historical data to formulate and test their research hypotheses. Areas for student investigation include the relationships among soil moisture, texture, mineralogy, chemistry, microfauna and vegetation; the relationships among bedrock, soils and vegetation; the partitioning of carbon or other nutrients in different parts of the field area, etc. Because the field area is likely to be very dry, we also bring students to a canyon stream to complete mini-projects on the physical, chemical and biological gradients associated with these features.

**Week 5: Biome management**
During this week students are introduced to the challenges of managing an ecosystem using examples primarily from Biosphere 2. Student teams collect data for projects such as relating water quality and quantity to vegetation and microfauna, comparing the morphology of plants grown inside and outside Biosphere 2, designing solutions for some of the technological or design problems of Biosphere 2, examining the role of human management in determining changes in the biotic communities in Biosphere 2, modeling nutrient cycles inside Biosphere 2, etc. Students compare their results to those from their field exercises, where appropriate.

Week 6: Coastal environments and marine ecosystems
During this week students travel to Rocky Point, at the northern edge of the Gulf of California. There, they help to collect data on the distribution and abundance of intertidal organisms, adding to a 15-year data set for this ecologically sensitive region. Students analyze pieces of this data set in an attempt to relate trends in commercial, residential and industrial development in the area and fresh water availability (tremendously depleted because of upstream use and diversion of the Colorado River) to changes in intertidal populations. Students also compare and contrast the limiting factors in marine and terrestrial ecosystems, and organism adaptations to these different environments.

Earth Systems Field School Session 2: Ecological Stewardship

Humans are changing the environment on a planetary scale. In a sense, we are planetary managers, whether consciously or unconsciously. This course is designed to teach basic skills in ecosystem management using the high-desert terrain outside, and the varied ecosystems inside Biosphere 2. The course stresses systems thinking and modeling skills that can be applied to management challenges at the global, as well as local scales.

This four-week course introduces students to field and computer-based techniques for observing, measuring, monitoring, modeling and managing ecosystems. The focus of Session 2 is management for the future, and complements Field School session 1 (six weeks) in that the first session focuses on understanding how the Earth and living systems arrived at their present state.

Biosphere 2 Center is set in a high desert-savanna landscape just north of the Santa Catalina mountains. Within a two-hour drive students can access pine forest (9000 feet), desert, grasslands, agricultural areas, cattle ranches, urban areas, and the varied ecosystems within Biosphere 2 (rainforest, mangroves, ocean, savanna and desert). This broad range allows students to learn about a number of different challenges to the sustainability of these ecosystems, such as changes in temperature, moisture, nutrient availability, acidity, salinity, light and toxic chemicals.

Week 1: Students are oriented to the area, learn basic rock and desert/savanna plant identification, tour inside Biosphere 2, explore ecological gradients in the Santa Catalina Mountains and inside Biosphere 2, and take a number of conditioning hikes to learn and practice map-reading, observational and record-keeping skills. They also get an introduction to systems and system modeling using Stella software.

Week 2: Students are introduced to scientific field methods by making and testing hypotheses about the distribution of life in the desert outside and the desert inside Biosphere 2. They look at the effects of cattle grazing, enhanced moisture and near-by development (ie, buildings, lawns, roads) on species distribution and soil properties.

Week 3: Students learn to make ecological comparisons by studying the various biomes inside Biosphere 2, as well as the gradients outside. From these exercises they gain insight into the limiting and critical factors that structure organisms as well as ecosystems. They concurrently build simple computer models of the carbon cycle inside Biosphere 2 and on the Earth. They then
develop management strategies for maintaining carbon dioxide at specified levels and test these strategies with their models.

Week 4: Students travel to several regional sites to study current environmental management issues: management of groundwater supply, biodiversity in riparian ecosystems, biodiversity of sky islands, the impacts of copper mining, range management and fire management.
Curriculum Vitae
Kevin Lee Griffin

Born: Newport Beach, California, September 5, 1962

Address
Lamont-Doherty Earth Observatory
of Columbia University
Route 9W, 6 Marine Biology.
Palisades, NY 10964

Phone: (914) 365-8371
Fax: (914) 365-8150
cmail: griff@ldeo.columbia.edu

Education
Duke University, Department of Botany, Durham, NC
Ph.D., Botany, August 1994

Yale University, School of Forestry and Environmental Studies, New Haven, CT
M.E.S., Forest Ecology, May 1987

Whittier College, Whittier, CA
B.A., Environmental Studies, May 1985

Professional Experience
Assistant Professor, Columbia University, Palisades, NY, May 1997

Assistant Research Professor, Desert Research Institute, Reno, NV, July 1996 - May 1997

Acting Director, Frits Went Laboratory, Desert Research Institute, Reno, NV, July 1996 - January 1

US Department of Energy, Global Change Distinguished Postdoctoral Fellow
Desert Research Institute, Reno, NV, September 1994 - July 1996

Research Assistant, Duke University, Durham, NC, August 1990 - August 1994

Laboratory Technician, Carnegie Institution of Washington, Stanford, CA, January 1988 - August 1

Biological Technician, US Forest Service Northeastern Forest Experiment Station, Hamden, CT June 1987

Research Assistant, Yale School of Forestry and Environmental Studies, New Haven, CT
September 1985 - May 1987

Field Research Assistant, Hubbard Brook Experimental Forest, NH, May - September 1986

Teaching Experience
Professor, EES 2100, The Climate System, Spring 1998

Professor, EES 2300, The Life System, Fall 1997
Guest Lecturer, General Ecology, Duke University, Fall 1991

Teaching Assistant, General Biology, Duke University, Fall 1990, Spring 1991

Laboratory Instructor, Historical Geology, Whittier College, Spring 1985

Grants Received

National Science Foundation, Integrative Plant Biology. 1997
$256,000 / 3 years

National Science Foundation, International Opportunities for Scientist and Engineers. 1996
$35,000 / 2 years

Nevada EPSCoR proposal development funds. 1996
$4,000 / 3 months

Biosphere 2 Center, seed grant. 1996
$25,000/year

Global Change Distinguished Postdoctoral Fellowship, U.S. Department of Energy. 1994
$74,000 / 2 years

/ 1 year

Catherine Kiever/Duke Botany Department research funds. 1991
$500 / 1 year

Mellon Foundation, student awards. 1986
$500 / 1 year
