SPACE MECHANISMS WORKSHOP

PREFACE

Future NASA space missions such as the Space Exploration Initiative (SEI), the Mission to Planet Earth, and advanced weather and communications satellites will require advanced performance standards, increased life, and improved reliability of all mechanically moving equipment (mechanisms). In the past the mechanism needs of spacecraft appeared to be well within the state of the art. The electronic systems were deemed to be the biggest impediment to producing long life and reliable operation. As a result satellites were designed with requirements to last for only 3 to 5 years. The electronics industry has made great strides over the last few years in reducing the size and increasing the life and reliability of satellite electronic systems. The question is, have mechanical moving mechanisms kept up in improving their life, reliability and performance?

To determine what the obstacles will be in meeting NASA’s future missions goals, NASA-Lewis Research Center and the Ohio Aerospace Institute (OAI) planned and sponsored a workshop for the fall of 1992. The workshop, entitled the Space Mechanisms Technology Workshop, took place September 22-23, 1992 at the Westlake Holiday Inn in Westlake, Ohio.

The workshop lasted for two days. The first half day was dedicated to a set of plenary papers. The following papers were presented:

(1) OVERVIEW OF FUTURE NASA MISSIONS AND REVIEW OF MECHANISM’S NEEDS SURVEYS -- ROBERT FUSARO, NASA/LERC

(2) SPACE MECHANISMS TECHNOLOGY NEEDS -- PAUL FLEISHAUER, THE AEROSPACE CORPORATION

(3) DOD SPACE MECHANISMS PROGRAMS -- KARL MECKLENBURG, WPAFB

(4) PLANETARY SURFACE REQUIREMENTS, AND ENVIRONMENT -- BENTON CLARK, MARTIN MARIETTA

(5) POWER REQUIREMENTS FOR SPACE -- JOHN BOZEK, NASA/LERC

(6) PROPULSION REQUIREMENTS FOR SPACE -- JAMES DILL, MECHANICAL TECHNOLOGIES INC.
Following the opening plenary session, the workshop broke into three concurrent groups to look at the issues and problems of future mechanism's operations. Because the Satellites and Space Platforms group was deemed to be too large it was divided into two working groups. The four groups and group leaders were:

(1) **Satellites and Space Platforms #1**, Doug Rohn, NASA LeRC and Paul Fleischauer, Aerospace Corporation

(2) **Satellites and Space Platforms #2**, Roamer Predmore, NASA GSFC, and Stuart Loewenthal, Lockheed

(3) **Power and Propulsion**, Bob Hendricks, NASA LeRC and Jerry Kannel, Battelle

Each group was given seven tasks, they were as follows:

1. Identify space mechanism's (mechanical components/lubrication) current and perceived future mission obstacles.
   (A) Brainstorm current space mechanisms obstacles.
   (B) Brainstorm future space mechanisms obstacles.
   (C) Prioritize current and future space mechanisms obstacles.

2. For each obstacle, list or describe:
   (A) Technology deficiencies (known or perceived).
   (B) The current state-of-the-art.
   (C) Applicable NASA, DOD, AND industry missions
   (D) Active research in the area.
      -- Where it is being conducted.
      -- What are the current facilities.
      -- Number of personnel involved.
   (E) Technology needs for current missions.
   (F) Technology needs for future missions.
   (G) Concerns.

3. What is needed to improve the reliability of mechanisms?

4. NASA is planning to develop a space mechanisms guidelines handbook. What sort of information should be included? What sort of information should be considered industry privileged?

5. Can anything be done to improve technology development and the dissemination of information?
6. Other issues?

7. What do we do next?
   - Future meetings
   - Formalized working group(s)
   - Publications

The workshop closed with a final half-day plenary session in which group chairman presented the results of their sessions and the attendees then engaged in discussion of those results. The working group results follow the preface.

Approximately 70 individuals attended the workshop. Their backgrounds and interests were diverse, ranging from basic research to satellite design and program management. A listing of the members of each group are given with the results of that group.

PERSPECTIVE

STRATEGIC DRIVERS

■ GLOBAL ECONOMIC COMPETITIVENESS
■ EFFECTIVE TECHNOLOGY TRANSFER
■ MORE COLLABORATION
■ POOL EXPENSIVE RESEARCH FACILITIES
■ MORE INTERDISCIPLINARY RESEARCH
■ MORE PHDs FOR INDUSTRY, GOVERNMENT, AND UNIVERSITIES
■ MORE AMERICANS IN GRADUATE SCHOOL
■ MORE MINORITIES AND WOMEN IN SCIENCE AND ENGINEERING
■ GREATER EMPHASIS ON SCIENCE AND MATH LITERACY IN SCHOOLS
PERSPECTIVE

ASSUMPTIONS

- Technology transfer is a body contact sport
- Federal labs — facilities and funding magnets
- Complementary equipment at campuses and companies
- Develop competitive critical mass
- Distance education is becoming more acceptable
  -- Technology, economics improving
  -- Fits changing lifestyle
- Increasing need for true life-long learning

RESEARCH FOCUS GROUPS

• WORKING GROUPS OF EXPERTS FROM UNIVERSITIES, GOVERNMENT, and INDUSTRY

• FOSTER COLLABORATION AMONG DISCIPLINES and COMMUNITIES

• ASSESS PRESENT AND FUTURE AEROSPACE RESEARCH THAT WOULD BENEFIT FROM COLLABORATIVE RESEARCH

---

OAI FOCUS GROUPS

• ADVANCED INTERDISCIPLINARY SIMULATION

• AEROSPACE POWER

• COMMUNICATION, ELECTRONICS, AND INFORMATION SYSTEMS

• COMPOSITES

• DIAGNOSTICS / IMAGING / VISUALIZATION

• DYNAMIC SYSTEMS AND CONTROLS

• FLUID DYNAMICS AND PROPULSIVE SYSTEMS

• ICING

• POLYMERS / MOLECULAR MODELING

• SPACE PROPULSION AND TECHNOLOGY

• TRANSDUCERS

• TRIBOLOGY

• TURBO MACHINERY FLUID MECHANICS
STATEWIDE COLLABORATIVE EDUCATIONAL NETWORK

- The University of Akron
- Case Western Reserve University
- University of Cincinnati
- Cleveland State University
- The University of Dayton

- The Ohio State University
- Ohio University
- The University of Toledo
- Wright State University

- Link universities by TV network
- Deliver graduate education to the workplace

OAI STUDENTS

- INDUSTRY - GOVERNMENT COLLABORATION ATTRACTING OUTSTANDING STUDENTS TO OAI UNIVERSITIES

- 52 GRADUATE, 78 UNDERGRADUATE SINCE 1989

"I had my choice of seven fellowship opportunities throughout the country. I chose OAI and Ohio State University because of the NASA involvement."

"Combining universities and industry is great. We get the theoretical side but not always the direct application."

"I saw OAI as a major advantage in making contacts in industry and learning from people who have experience in more than an academic setting."

"OAI is a great step forward in laying the groundwork to make Ohio competitive in the aerospace field. It offers the opportunity to do things I couldn't do elsewhere."

31 participating business organizations
Objectives

- To obtain an industry/university/government perspective on what are the known or perceived obstacles to successfully achieving NASA's current and future space missions.

- To determine the industry/university/government community's capabilities of solving these obstacles.

- To obtain input to help guide NASA in the formation of a growing R&T program.
Space Mechanisms Workshop

Definition

WHAT IS A SPACE MECHANISM

- Any moving assembly or component used in a space application
  -- Rolling element bearings
  -- Magnetic bearings
  -- Power transmission drives
  -- Lubricants
  -- Seals
  -- Electrical sliding contacts
  -- Motors
  -- Deployment devices, latches, connectors
  -- etc. etc.
SPACE MECHANISMS PROGRAM
PLANNING METHODOLOGY

NASA MISSION

- Planet Earth
- Astrophysics
- Planetary & Lunar Exploration
- Material & Life Science

Elements/Sub-Elements

- Planet Observation Sys.
  - Orbiters
  - Probes
- Telescopes
- Space Laboratories
  - Space Station
  - Unmanned Platforms
- Surface Operations
  - Landers
  - Sample Return
  - Land Rovers
  - Construction
  - Manufacturing
- Power/Propulsion
  - Terrestrial
  - Space

Mechanical Systems

- Solar Array Drives
- Pointing Devices
- Robotics
- Deployment Devices
- Despin Drives
- Antenna Drives
- Momentum Wheels
- Drive Reducers
- Pumps
- Turbopumps
- Latches
- Release Mechanisms
- Transmissions
- Cryo-Coolers
- Gimbals

Components

- Traction Drives
- Rolling Element Bearings
- Magnetic Bearings
- Lubricants
- Motors
- Gears
- Seals
- Electrical Sliding Contacts
- Joints

Basic Discipline Research

- Dynamic Analysis
- Contact Analysis
- Tribology
- Accelerated Testing Methods
- Other
Space Mechanisms Workshop

Issues

- Operating Parameter Effects
  -- Endurance life, and Reliability
  -- Pointing Accuracy -- Stability, Vibrations, etc.
- Environmental Effects
  -- Space Radiations, Atomic Oxygen, etc.
  -- Temperature, vacuum, dust, etc.
  -- Contamination of and from Environment
- Electrical Effects
  -- Power and Signal Transfer
- Tribological Effects
  -- Friction, Wear, Lubrication
- Storage Effects
- Launch Effects
- Ground Based Testing Methods
Space Mechanisms Workshop

Potential NASA Funding

- Proposed Code R Funding
  - $4.9M for Technology Development (FY94)

- Proposed Code Q Funding
  - Lesson Learned Study (FY93)
  - Space Mechanisms Guidelines Manual (FY93)
  - Reliability Improvement Research (FY 94)

SPACE MECHANISMS TECHNOLOGY WORKSHOP
AGENDA

TUESDAY AFTERNOON

1:00 - 5:00
WORKING GROUP SESSIONS
-- SATELLITES/PLATFORMS (2 Groups) (Dover)
-- PLANETARY SURFACES (Canterbury)
-- PROPULSION/POWER (Bradley)

3:00 - 3:30
BREAK

6:00
SOCIAL HOUR (Corker's Lounge)
-- CASH BAR

7:00
BANQUET AND KEYNOTE SPEAKER (Dover Ballroom)
-- RED WHITTAKER, CARNEGIE MELLON UNIVERSITY
SPACE MECHANISMS TECHNOLOGY WORKSHOP
AGENDA

WEDNESDAY MORNING

7:30  BREAKFAST (Corker's Lounge)
8:00  PLENARY REVIEW OF PROGRESS ON TUESDAY
8:30  WORKING GROUP SESSIONS CONTINUE
10:00 - 10:20  BREAK
12:00  LUNCH (Corker's Lounge)

WEDNESDAY AFTERNOON

1:00  PLENARY SESSION -- WORKING GROUP CONCLUSIONS
3:20  CONCLUDING REMARKS -- THEO KEITH, OAI
3:30  ADJOURN
WORKSHOP WORKING GROUP
OBJECTIVE QUESTIONS

1. IDENTIFY SPACE MECHANISM’S (MECHANICAL COMPONENTS/LUBRICATION) CURRENT AND PERCEIVED FUTURE MISSION OBSTACLES.
   (A) BRAINSTORM CURRENT SPACE MECHANISMS OBSTACLES
   (B) BRAINSTORM FUTURE SPACE MECHANISMS OBSTACLES
   (C) PRIORITIZE SPACE MECHANISMS OBSTACLES

2. FOR EACH OBSTACLE, LIST OR DESCRIBE:
   (A) TECHNOLOGY DEFICIENCIES (KNOWN OR PERCEIVED?)
   (B) THE CURRENT STATE-OF-THE-ART
   (C) APPLICABLE NASA, DOD, AND INDUSTRY MISSIONS
   (D) ACTIVE RESEARCH IN THE AREA
      -- WHERE IS IT BEING CONDUCTED AND THE FACILITIES
      -- NUMBER OF PERSONNEL INVOLVED
   (E) TECHNOLOGY NEEDS FOR CURRENT MISSIONS
   (F) TECHNOLOGY NEEDS FOR FUTURE MISSIONS
   (G) CONCERNS
WORKSHOP WORKING GROUP
OBJECTIVE QUESTIONS

3. WHAT IS NEEDED TO IMPROVE THE RELIABILITY OF MECHANISMS?

4. NASA IS PLANNING TO DEVELOP A SPACE MECHANISMS GUIDELINES HANDBOOK. WHAT SORT OF INFORMATION SHOULD BE INCLUDED? WHAT SORT OF INFORMATION SHOULD BE CONSIDERED INDUSTRY PRIVILEGED?

5. CAN ANYTHING BE DONE TO IMPROVE TECHNOLOGY DEVELOPMENT AND THE DISSEMINATION OF INFORMATION?

6. OTHER ISSUES?

7. WHAT DO WE DO NEXT?
   -- FUTURE MEETINGS
   -- FORMALIZED WORKING GROUP(S)
   -- PUBLICATIONS
# WORKING GROUP ASSIGNMENTS

PROPOSED FUTURE NASA MISSIONS

- SPACE EXPLORATION INITIATIVE (SEI)
  -- Expand human presence to the moon, Mars, and beyond

- MISSION TO PLANET EARTH
  -- Understand the interaction between
    -- Oceans/atmosphere/solid Earth (weather)
    -- Living organisms and environment
    -- Environment and pollution
    -- Composition and evolution of the Earth

- ASTROPHYSICS
  -- Understand the universe
    -- Laws of physics
    -- Birth of stars and planets
    -- Advent of life

- MATERIAL AND LIFE SCIENCES
  -- Understand and develop new processes
    -- Fluid dynamics
    -- Combustion fundamentals
    -- Material processing
    -- Physics and Chemistry
    -- Space Medicines

QUESTIONNAIRE RESPONSE
SPACE MECHANISMS TECHNOLOGY ISSUES

--- Currently it is left to each project to fund any mechanisms development to meet mission requirements, this leads to wheel reinvention.

--- The contractors we deal with are hesitant to reveal the best solution to a problem because it was developed for another customer.

--- Mechanisms are typically mission critical devices that cannot be redundant in many cases and have little tolerance for error.
QUESTIONNAIRE RESPONSE
SPACE MECHANISMS TECHNOLOGY ISSUES

--- There is a need for long term commitment to an IR&D program that has direction and is technology focused not project oriented.

--- Past NASA Missions have been compromised by not developing enabling technology as part of the pre-project activities.

--- All efforts on space mechanisms have been program driven, long time goals have been lacking.
SPACE MECHANISMS WORKSHOP FINDINGS

SIGNIFICANT PROGRAMMATIC ISSUES

● NASA FACES IMMINENT FAILURES IF SPACE MECHANISM'S TECHNOLOGY ISSUES ARE NOT BETTER ADDRESSED

● FUTURE LONG DURATION MISSIONS WILL BE JEOPARDIZED IF THE TECHNOLOGY BASE IS NOT IMPROVED

● LACK OF ADEQUATE NASA FACILITIES FOR ACCELERATED LIFE, ENVIRONMENTAL AND FUNCTIONAL TESTING

● NASA EXPERTISE RETIRING, NEW PEOPLE NOT BEING TRAINED, CREATING A LOSS OF CORPORATE MEMORY

● NO ONE AT NASA HQS TO DEAL WITH MECHANISMS TECHNOLOGY, MECHANISMS NEEDS RECOGNITION AS A DISCIPLINE
SPACE MECHANISMS WORKSHOP FINDINGS

SIGNIFICANT TECHNOLOGY ISSUES

- CAN'T DESIGN FOR DECADES OF USEFUL LIFE
- MECHANISMS/TRIBOLOGY TECHNOLOGY BASE 20 YEARS OLD
- NO GUIDELINES, HANDBOOKS, OR STANDARDS FOR DESIGNERS
- AN INADEQUATE UNDERSTANDING OF FAILURE MODES
- ACCELERATED TESTING FOR "30 YEAR LIFE" IS AN UNKNOWN
- POTENTIAL ENVIRONMENTAL EFFECTS DIFFICULTIES MAY EXIST
- STORAGE PRIOR TO LAUNCH A SIGNIFICANT PROBLEM
- OPERATION AT LOWER CRYOGENIC TEMPS (2.6°C VS 77°C)
- SERVICEABILITY OF MECHANISMS NOT BEING CONSIDERED
- VIBRATION ISOLATION IMPORTANT ON LARGE PLATFORMS
SPACE MECHANISMS WORKSHOP FINDINGS

TECHNOLOGY IMPLEMENTATION NEEDS

● MECHANISM DESIGN RULES AND GUIDELINES MANUAL
● VALIDATED ACCELERATED TEST METHODS
  -- FOR CRITICAL COMPONENTS
  -- FOR HARSH ENVIRONMENTS
● CATALOG OF HISTORICAL MECHANISM/TRIBOLOGICAL PROBLEMS AND SOLUTIONS FROM PREVIOUS NASA MISSIONS
● AEROSPACE MECHANISMS SYMPOSIUM TO PRESENT MORE PAPERS ON SPACE MECHANISMS TECHNOLOGY
● FOCUSED WORKING GROUPS ON SPECIFIC PROBLEM AREAS
SPACE MECHANISMS TECHNOLOGY NEEDS

Space Mechanisms Technology Needs

Introduction

- The Aerospace Corporation Functions as an "Architect-Engineer" for National Security Programs
- Specializes in Advanced Military Space Systems
- Technology Operations Conducts Scientific Research and Promotes the Insertion of Advanced Technologies
- Support is Provided to Programs in Launch Vehicles, Navigation, Meteorology, Communications, & Surveillance
Space Mechanisms Technology Needs

Outline

- Introduction to S/C Mechanisms, Moving Mechanical Assemblies, Mechanical Subsystems
- MMA Functions - Program Requirements & Technology Needs
- Mechanical Subsystem/Component Performance
- New Technologies - Research and Testing
- MMA Case Studies
- Summary and Conclusions
Major Spacecraft Subsystems

- Guidance, Navigation, & Control
- Communications - "Up/Down" & "Cross"
- Command & Data Handling
- Power - Solar Cells, Batteries, etc.
- Thermal - Passive, Semi-passive, & Active
- Structures & Mechanisms

*Other systems have advanced and made mechanisms life-limiting*
Mechanical Subsystems

High-Cycle Mechanisms

- Antenna Pointing & Tracking
- Solar Array Pointing & Tracking
- Attitude Control - Reaction, Momentum Wheels, CMGs
- Boom Extensions

Low-Cycle Mechanisms

- Antenna Launch Retention/Deployment
- Solar Array Retention/Deployment
- Contamination Cover Removal
- Spacecraft/Launch Vehicle Separation
Typical Deployment Mechanisms
Moving Mechanical Assembly Functions
Reaction Wheel Assembly

**Issues**

- Lifetime
- Torque Stability
- Reliability
- Producibility

**Technologies**

- Ceramic & Ceramic-Like Coatings/Parts
- Synthetic Lubricants
- Feedback Control
- Sensors/Systems (Health Monitoring)
Solar Array Drive Mechanism

Issues

Environmental Stability
Low Noise Slip Rings
Reliability
Producibility

Technologies

Conductive Solid Lubricants
Ceramic & Ceramic-Like
Coatings/Parts
Sensor Pointing Gimbal

Issues
Low, Constant Torque
Low Torque Noise
Reliability
Wide Temp. Range
Long Life

Technologies
Ceramic & Ceramic-Like Coatings/Parts
Ultra-Low Friction Solid Lubes
Synthetic Lubes, Selected Systems
Adaptive Bearing Designs
Mechanical Subsystem/Component Performance

Current Tribology Problems with Active Spacecraft

- Recurrent Problem with Bearings in Reaction/Momentum Wheels, CMGs, & Gyroscopes

- Problems with Actuators, Gears, & Gimbals Operating in Boundary Lubrication Regime

- Consistent Difficulties with Low-Noise Operation of Slip Rings
  - Noise not Understood
  - Materials Development Missing
  - Primary Application in Solar Array Drives

- Other Problems with Turbo-Machinery, Cryopumps, Coolers

- Occasional Problems with Release & Deployment Mechanisms
  - Need for Proper Guidance from "Tribologists"
### TRIBOMECHANISM/COMPONENT PERFORMANCE

New Technologies - Solutions to Problems

Lubricants
- Synthetic Oils
  - Tailored Properties, Low Volatility, Viscosity of Choice,
    Low Pour Point, Low Reactivity
  - Increased Life, Factor of 10
- Sputter-Deposited Solid Lubricant Thin Films
  - Ultra-Low Friction
  - Low Noise, Debris
  - Long Life
  - Conductive Films

Wear Resistant Materials
- Hard Coatings & Ceramic Parts
  - Ultra-Smooth Surfaces, Low Torque Noise
  - Little or No Wear
  - Need for Designer Lubricants - Additive Criteria
New Technologies - Solutions to Problems
(Cont’d.)

Health Monitoring - Feedback Control
- Sensors
  - Performance Monitoring
  - Lubricant Failure Criteria
  - Structure, Balance Shift
  - Induced Vibration

- Data Processing
  - On Board
  - Minimum Interrogation

- Remedies
  - Lubricant Replenishment

Adaptive Bearing Designs
- Built-In Jitter Control
  - Low Torque Noise
Surface Studies of Lubricant Additives

Function and Performance of Additives Depend on Type of Surface Interaction

Antiwear, Film-Forming Additives

- Film Thickness Increases with Use
- Reduces Wear
- Can Increase Friction/Torque

Friction Reducing Additives

- Form Very Thin Reaction Layer on Contacting Surfaces
- Friction Modification Influences Fluid Properties
- Synthetic Oils Affected Differently Compared to Mineral Oils
Chemical States of PbNp on Bearing Steel
Lubrication of Spacecraft Mechanisms

Lubrication of Spacecraft Mechanisms

Summary

- Mechanical Subsystems Anomalies/Failures due to Lubrication Problems

- Other Subsystems Technologies Advancing More Rapidly
  - Lubrication (Tribology) Becoming the Limiting Technology

- Two Primary Types of Lubrication Problems
  - Supply or Loss of Lubricant
  - Chemical Reaction (Oxidation, Polymerization) of Lubricant

- Subsystems with the Most Problems Include Momentum Stabilization Devices (Wheels), Gimbals & other Boundary Lubricated Devices, Sliding Electrical Contacts, Gyroscopes

- Technological Solutions Include Synthetic Lubricants and Hard, Anti-wear Coatings for Contacting Parts
Space Mechanisms Technology Needs

Conclusions

- Technologies (New Materials, Processes) Exist to Solve Most Lubrication Problems
- Testing Needed to Demonstrate Technologies for Program Insertion
- Contractors Typically Hesitant to do Testing at Screening and Component Level
- Independent Testing Capabilities Needed to Assist Programs and Contractors
TOPICS THAT COULD BE PRESENTED:

DESCRIPTION: DEMONSTRATION, TRANSITION, AND INSERTION OF HEALTH/CONDITION MONITORING TECHNOLOGY INTO VARIOUS SDI MOVING MECHANICAL ASSEMBLY SYSTEMS. CONTRACTOR ACCEPTANCE OF THIS GENERIC TECHNOLOGY WOULD LENGTHEN OPERATIONAL LIVES OF SDI SYSTEMS SATELLITES

CONTRACTOR LOCATION: BENDIX/ALLIED SIGNAL, TETERBORO, NJ
HUGHES AIRCRAFT, EL SEGUNDO, CA
SPERRY/HONEYWELL, PHOENIX, AZ
LOCKHEED MISSILES & SPACE, SUNNYVALE, CA

SPECIFIC CONTRACTORS
DEPEND ON PROGRAM
FINDINGS & DIRECTIONS

PROJECT GOALS & OBJECTIVES

- DEVELOP/VALIDATE HEALTH MONITORING TECHNOLOGY INTO SATELLITE MOVING MECHANICAL SYSTEMS
- DEMONSTRATE CONTROL OF BEARING PRELOAD
- DEMONSTRATE VIBRATION CONTROL/SUPPRESSION IN COMBINED DEMO EFFORT WITH STRUCTURES/VIBRATION CONTROL TASKS

BENEFITS

- TECHNOLOGY INSERTION
- USER ACCEPTANCE OF ADVANCED TECHNOLOGY OF BEARING PRELOAD DETERMINATION AND CONTROL, CRITICAL TEMPERATURE MEASUREMENT AND CONTROL, FRICTIONAL TORQUE AND TORQUE NOISE

PROGRAM ELEMENT

- SUPPORTS:
  -- GENERIC
  -- BRILLIANT EYES
  -- GLOBAL PROTECTION AGAINST LIMITED STRIKES

ADVANCED CERAMIC TECHNOLOGY
INSERTION PROGRAM

PROGRAM OBJECTIVE:

DEMONSTRATE PRODUCTION VIABILITY (EQUIVALENT RELIABILITY) FOR CERAMIC ENGINE COMPONENTS WHICH ARE EXPECTED TO ENABLE THE POWER EXTENSION OF THE CURRENT 8V-71T (440 BHP) FOR THE M109 SELF-PROPELLED HOWITZER, TO 500 BHP.

DELIVERABLES:

- CERAMIC COMPONENT DRAWINGS AND MATERIAL/PROCESS SPECIFICATIONS
- TEST DEMONSTRATOR ENGINE
OBJECTIVES

- Exploit ceramic technology to provide improved bearing.
- Combine ceramic ball properties, appropriate race material properties, and lubricants to improve bearing usefulness.
- Qualify a domestic source for bearing manufacture.
- Qualify the bearing for a military application.
- Field the new bearing in operational platform.
Objective

- Develop Form-Factored Silicon Nitride Spin and Gimbal Bearings for Missile Homing Improvement Program (MHIP) Common IR Seeker

Approach

- Design Gimbal With Silicon Nitride Spin and Gimbal Bearings
- Fabricate Bearings
- Assemble Gimbals
- Retrofit Gimbal/Gyro Assemblies into 3 MHIP Prototype Seekers
- Deliver 1 Seeker to Naval Air Warfare Center for Evaluation
- Baseline MHIP Performance Testing on 2 Remaining Seekers
- Repeat Performance Tests
**Objectives**

- Demonstrate the benefits of state-of-the-art ceramic matrix composites in order to increase the insertion rate of these materials into production military systems

**Approach**

- Build On Successful CMC Engine Experience
- Involve Suppliers By Integrated Product Team (IPT)
- Finalize Material Selection With Critical Screening Tests
- Optimize Material Process
- Verify Design Methods and Specification Data Through Subelements
- Test to Supplement Design Database
- Fabricate Seals For Test Verification / Engine Demonstration

---

**Expected Major Results**

- Establish an Optimized Repeatable Material Process
- Demonstrate Reliability, Durability, and Productibility of F100 Ceramic Matrix Composite Divergent Seal
- Ready Ceramic Matrix Composite Component for Insertion in F100 Engine Family

---

![F100 Divergent Seal](image)
INTRODUCE CERAMIC MATRIX COMPOSITE COMPONENTS TO F110 PRODUCT ENGINES, AS FOLLOWS:

- HOT SECTION APPLICATION, CONSISTENT WITH TEMPERATURE CAPABILITIES OF THE CMC;

- LOW RISK APPLICATION, CONSISTENT WITH THE MATERIAL PROPERTIES OF CMC;

- CURRENT HIGH MAINTENANCE COMPONENT, TO PRODUCE A BENEFIT FOR THE PRODUCT LINE;

- INTRODUCTION AS EARLY AS POSSIBLE, CONSISTENT WITH ENGINE SUBSTANTIATION AND QUALIFICATION TOLLGATES AND REQUIREMENTS.
OBJECTIVES:

- Demonstrate system benefits of replacing ZK-N7 Glass domes on Harrier ARBS system with transparent spinel
- Maintain Optical compatibility to ensure interchangability
- Demonstrate potential benefits of using transparent spinel in similar systems

APPROACH:

- Focus on Producing Spinell ARBS domes with excellent optical quality
- Compare Spinell with ZK-N7 Glass optical performance: resistance to solid particle/rain/hail environments
- Compare Spinell with ZK-N7 in respect to birdstrike resistance
- Perform optical testing to demonstrate interchangability of Spinell with ZK-N7

EXPECTED MAJOR RESULTS:

- Spinell domes can be substituted for ZK-N7 Glass with no loss in optical performance
- Replacement of Domes, (if needed at all) will occur in increments of years rather than months
- Dramatic reduction in Life Cycle Costs
CERAMIC TECHNOLOGY INSERTION PROGRAM

- P&W CONTRACT INITIATED 3 APR 92
- FUNDED BY DARPA - $1.5M (FY91-94)
- HYBRID CERAMIC (Si₃N₄ BALLS/STEEL RACES) REPLACES ALL-STEEL BEARING
- DURABILITY IMPROVEMENT
- HIGH TEMP/HIGH DN IHPTET GOALS NECESSITATE CERAMIC ROLLING ELEMENTS
Allied-Signal Aerospace Company
Garrett Auxiliary Power Division

Objective

Demonstrate integrity and durability of ceramic turbine nozzles in long-term engine endurance and fielded ground cart tests

Approach

- Design and demonstration testing completed under Allied-Signal funding
- Fabricate metal and ceramic hardware to convert nine GTCP85-180 gas turbine engines (GTEs) to the ceramic turbine nozzle configuration
- Perform endurance testing at GAPD
  - Two units for one year will operate for 5,000 hours
  - Two units for 2.5 years will operate for 15,000 hours
- Perform field testing of five units at Luke AFB for 2.5 years

Expected Major Result

Generate test experience that will facilitate the use of ceramic components in turbine engine production

Ceramic Turbine Nozzle Insertion

**TELEDYNE CAE**

89098

*81374*
**OBJECTIVES**
- Apply Engineering Ceramics to Wear Critical Components in the S-3A/A-10 Constant Speed Drive increasing Reliability and Performance

**BENEFITS**
- Increased MTBF Through Reduced Wear
- Increased Catapult Start Reliability Through Improved Low Lube Tolerance
- Increased Survivability Through Increased Contamination Resistance
- Increased Efficiency Through Higher PV-Wear Capability

**APPROACH**
- Comparative Wear Testing of Ceramic Materials
- Iterative Design Approach Using Finite Element Analysis, NASA-CARES, and Concurrent Engineering for Design to Cost
- Design Interchangeability for Easy Insertion
- Proof, Rig and CSD Testing for Performance Including Endurance, Off Deprivation, Cold Start, High Temperature, and Efficiency

**INSERTION PLAN**
- NATC Flight Testing in Non-Dedicated S-3As
- Preferred Spares Substitution in S-3A, A-10
- Coordinated Through S-3A Class Desk, Wash. DC, NAWC, Pax River, OC-ALC, Tinker AFB
# CERAMIC BEARING PROGRAM

## OBJECTIVES

- Demonstrate ability to incorporate ceramic hybrid ball bearings in existing cooling turbines, with minimum impact on turbine design.
- Demonstrate successful operation of cooling turbines during laboratory testing.
- Demonstrate successful flight tests; retrofit fleet.

## APPROACH

- Analyze existing bearing designs for conversion to ceramic hybrid bearings.
- Conduct life cycle cost study to verify hybrid bearing advantage.
- Incorporate hybrid bearings in 3 cooling turbines and conduct 50 hour accelerated tests:
  - Monitor bearing and oil mist temperature
  - Monitor vibration
- Perform flight evaluation tests:
  - Use C130, F111 and F15 cooling turbines
  - Evaluate up to 10 units of each configuration

## MILESTONES

- Design and analysis of bearings and mounting methods (January 1983)
- Completion of fifty hour accelerated test program on three different cooling turbines (July 1983)
- Completion of flight test of ten cooling turbines of each configuration (October 1984)

## FLIGHT TEST EVALUATION

- One year test program
- Conducted by USAF OC/ALC; assisted by AiResearch
- AiResearch to provide disassembly and bearing analysis following flight test

CERAMIC BEARING TECHNOLOGY PROGRAM

CONTRACTOR: Ceramatec, Inc

TITLE: Layered Ceramic Composite Bearings

OBJECTIVE: Develop Bearings with Si$_3$N$_4$ Layer on SiC Substrate Having Residual Compressive Stresses in Si$_3$N$_4$ Layer

APPROACH: Use Slipcasting and Co-Sintering Approaches to Fabricate Layered Ceramic Composite with Compressive Stresses Produced by Thermal Mismatch

PROGRAM: Program Limited to Two Tasks - Approaches for Introducing Compressive Stresses and Fabrication of Layered Ceramic Composites
CERAMIC BEARING TECHNOLOGY PROGRAM

CONTRACTOR: BIRL, Northwestern University

TITLE: Ceramic Coated Bearings

OBJECTIVE: Deposition of Hard Ceramic Coatings on M50 and Si$_3$N$_4$ Balls and RCF Rods

APPROACH: Deposit TiN, TiAlN$_2$, and CrN Coatings via Sputter Deposition Process. Thoroughly Characterize Coatings via Acceptable Techniques Prior to Delivery

PROGRAM: Program Limited to Two Tasks – Deposition of Hard Coatings and Coating Characterization
CERAMIC BEARING TECHNOLOGY PROGRAM

CONTRACTOR: Wedeven Associates, Inc

TITLE: Run-In Finishing and Tribological Performance

OBJECTIVE: Develop Techniques for Providing Final Polishing of Ceramic Components via Run-In Concepts in Assembled Bearings

APPROACH: Use Si$_3$N$_4$ Balls and Discs with Rough Ground Surfaces to Demonstrate Run-In Self-Polishing Concept. Characterize Surfaces and Evaluate for Tribological Performance

PROGRAM: Program Funded as Proposed
CERAMIC BEARING TECHNOLOGY PROGRAM

CONTRACTOR: The Torrington Company

TITLE: Rotating Beam Fatigue - Hybrid Bearings

OBJECTIVE: Develop Improved Reliability Prediction Techniques and Establish Defects/Fatigue Performance Relationships for Si$_3$N$_4$

APPROACH: Use Rotating Beam Fatigue Tests to Establish Relationship Between Material Microstructure and Fatigue Performance. Verify in Endurance Tests with Hybrid Ceramic Bearings

PROGRAM: Program Funded as Proposed
# CERAMIC BEARING TECHNOLOGY PROGRAM

**CONTRACTOR:** Oklahoma State University  
**TITLE:** Ceramic Bearing Program  
**OBJECTIVE:** Develop Improved Manufacturing Technologies for Si$_3$N$_4$ Ceramic Bearing Materials. Investigate NDI Methodologies for Optimal Techniques for Assessing Surface Damage  
**APPROACH:** Use Gentle Grinding Process to Reduce Damage to Ground Surfaces. Extend Gentle Processes to Polishing Concepts via Magnetic Field Assisted Polishing. Correlate Surface Properties with Tribological Performance  
**NDE:** Investigate Raman Scattering, RF Absorption, Brillouin Scattering, and Direct Coupling Photo-Acoustic NDI Techniques  
**PROGRAM:** Program Limited to Two Tasks - Gentle Grinding and Polishing Techniques and Most Promising NDI Techniques (above)
CERAMIC BEARING TECHNOLOGY PROGRAM

CONTRACTOR: CERBEC, Inc

TITLE: Ceramic Bearing Development

OBJECTIVE: Develop Improved Characterization and Inspection Techniques for Si₃N₄ Ceramic Bearings

APPROACH: Develop General Methodology for Understanding How Defects Affect Tribological Performance and Role that Production Processes Have on Producing Basic Defects

NDE: Application of Ultrasound and Scanning Acoustic Inspection Techniques to Finished Balls

PROGRAM: Program Limited to Four Tasks - Bearing Tests with Artificial Flaws; Thermal Quench Proof Tests; Wear and Fatigue Tests; Tribocemical Finishing Techniques
CERAMIC BEARING TECHNOLOGY PROGRAM

CONTRACTOR: The Torrington Company

TITLE: Improved Hybrid Bearings

OBJECTIVE: Develop Nitrided Metallic Races with Hardness and Surface Properties Approaching \( \text{Si}_3\text{N}_4 \). Use M50 and M50NiL Substrates

APPROACH: Investigate Nitriding and Ferritic Nitrocarburizing Techniques. Consider Combinations of Nitriding and Nitride Coatings from BIRL Program (TiN, TiAlN\(_2\), CrN). Evaluate with Si\(_3\)N\(_4\) Rolling Elements

PROGRAM: Program Funded as Proposed
CERAMIC BEARING TECHNOLOGY PROGRAM

CONTRACTOR:  GE Aircraft Engines

TITLE:  Engine Hybrid Ceramic Bearings

OBJECTIVE:  Develop Improved Performance Data and Condition Monitoring Techniques for Si₃N₄ Hybrid Bearings

APPROACH:  Establish Induced Defect Performance Relationships for Si₃N₄ Bearings. Obtain Comparative Test Data for All-Steel and Hybrid Si₃N₄ Bearings. Develop Condition Monitoring Device for Detecting Onset of Bearing Failure

PROGRAM:  Program Limited to Three Tasks - Induced Defect Tests; High Speed Bearing Tests; Condition Monitoring Techniques/Prototype Development
CERAMIC BEARING TECHNOLOGY PROGRAM

CONTRACTOR: AVCON, Inc

TITLE: Computerized Design and Life Prediction - Bearings

OBJECTIVE: Develop Improved Si$_3$N$_4$ Bearing Design Concepts via Modifying Metal Bearing Computer Design Codes with Si$_3$N$_4$ Material Properties/Characteristics

APPROACH: Tailor Existing Computer Algorithms to Include Si$_3$N$_4$ Properties and Develop Integrated, Efficient Program for Design of Ceramic Bearings. Seek Input from Bearing Manufacturers for Guidance

PROGRAM: Program Funded as Proposed
CERAMIC BEARING TECHNOLOGY PROGRAM

CONTRACTOR: Mechanical Technology, Inc

TITLE: Ceramic Bearing Technology

OBJECTIVE: Develop Improved Performance Prediction and Tribological Test Techniques for Si₃N₄ Bearings

APPROACH: Establish Material Property Performance Relationships for Two Baseline Si₃N₄ Materials and Comparative Data on Four Additional Si₃N₄ Materials from Other DARPA Contractors. Develop Guidance for Optimizing Production Processes

PROGRAM: Program Funded as Proposed
MATERIALS TECHNOLOGY AREA PLAN
NONSTRUCTURAL MATERIALS

- PROBLEMS IN SEVERAL SYSTEMS WITH CURRENT MINERAL OIL - (VACKOTE)
  - OIL TOO VOLATILE
  - LOW TEMPERATURE TORQUE TOO HIGH
  - EXCESSIVE BEARING WEAR

<table>

</tbody>
</table>

- SOLUTION: REPLACE VACKOTE WITH LOW VOLATILITY, REPRODUCIBLE SYNTHETIC BASE STOCK
  - SILAHYDROCARBON #1
  - SILAHYDROCARBON #2
  - CANDIDATE ADDITIVES AVAILABLE FROM OTHER PROGRAMS

MILESTONES:
FY93 - OPTIMIZE BASE FLUIDS
FY94 - OPTIMIZE FORMULATIONS
FY95 - VALIDATE OPTIMIZED CANDIDATES IN SPACE BEARING SIMULATION CHAMBER
LOW FRICTION DIAMOND FILMS FOR HIGH PAYOFF CERAMIC BEARING APPLICATIONS

Goals:
• Develop Diamond Ceramic Application

• Greater Understanding of Diamond Film Wear Behavior
DIAMOND COATED BALL BEARING
Diamond-Coated Ball Bearing

Silicon Nitride Ball
3mm Diameter

LB.V.G-2 9/20/92
Radiation Hazard

- Mars and moon both have Cosmic Ray and Solar Flare Particle Events (SPE)
- Mars missions entail longer periods outside geomagnetic shield
  1 to 3 years GCR dose for Mars
  0.03 to 0.5 yr GCR does for moon
- Solar Monitoring:
  Lunar: from Earthbased observatories (ala Apollo)
  Mars: must be provided on-board
- Martian atmosphere provides significant shielding
  (16 g/cm² at zenith -- much more at oblique angles)
Descent Technologies

Moon

De-orbit and landing technique
- All-propulsive. Major deorbit burn
- Very wide-range throttling required, especially if use turbopumped propulsion

Navigation
- Landmark updates for orbital state vector
- Earth-link to aid descent landing accuracy
- Terminal navigation by astronauts to achieve pinpoint landing
  (deployed radio beacons not required)

Mars

De-orbit, entry and landing technique
- Combination of
  - minor burn for deorbit retro-propulsion (15 m/s)
  - aerobraking
    - numerous L/D options
    - zoom, glide maneuver options
  - parachute-assisted deceleration may be possible
- terminal descent propulsion and maneuvering

Navigation
- Deimos or Mars ComSat reference navigation
- Earth nav not adequate
- Deployed radio beacon(s) on surface may be required for pinpoint landings
Ascent Vehicle Design

Moon

- No requirement for aerodynamic shaping to minimize drag
- Direct-to-Earth option; low lunar circular orbit option
- For resources exploitation, requires major surface payload launch capabilities

Mars

- Aerodynamic drag, dynamic pressure, thermal protection are design considerations
- Rendezvous in high elliptical orbit
  (intermediate staging in LMO, then time-synchronized apoapsis raise)
Surface Power Generation and Storage

Solar Electric - Photovoltaic or Solar Dynamic Conversion

Lunar: Disturbed dust protection (ballistic shadowing)
Lunar night outages, cold thermal stresses (-170 ° C)

Mars: Disturbed dust, man-induced
Disturbed dust, natural (windstorms)
Settling from atmosphere (multiple monolayers per season)
Direct flux attenuation; skylight omnidirectionality (scattered flux)
24.6 hr temperature cycling (-100° to 0° C)

Solar Thermal - Direct Concentration

Lunar: High grade heat for chemical processing

Mars: Not feasible because of atmospheric scattering
(also faster slews required, outages every 12 hrs)

Phobos: Similar to Lunar, but much faster slew

Nuclear - RTG, SP-100, Advanced Reactor, Fusion

Lunar: SP-100: vacuum environment; nighttime temp concern(?)
Fusion: 3He based system, ultimately?

Mars: Oxidizing atmosphere
Dust effects on heat radiators
Windblown dispersal renders release accident more catastrophic

Note: Lunar Base resource production implies power-rich facility.
Lower power anticipated for Mars, especially if nuclear reactors forbidden on martian surface.
Mission Operations

Communication Time Delays

Lunar: 3 seconds roundtrip
Mars: 8 to 40 minutes roundtrip

Daytime synchronization

Lunar: astronauts adopt Mission Control time standard
Mars: Every 3 weeks, day/night become opposite that of Earth reference time zone

Astronaut corps size (assumes 8 person crews)

Lunar: up to 32 per year (90 day duty tours)
Mars: less than 4 per year

Medical contingencies rescue times

Lunar: 3 days minimum delay to return to Earth
Mars: up to 3 year delay to return to Earth
Orbital Activities

Earth Orbit

**Mars mission:** 5 to 15 HLLV launches per mission
Assembly/docking required to configure for flight
Propellant loading on-orbit
Expendable vehicles more likely

**Lunar mission:** 1 to 3 HLLV launches per mission
System launched in all-up configuration
Propellant loading on-orbit for reuse
Refurbishment/inspection of returned vehicles

Mars Orbit

Optimally, interplanetary transfer vehicle remains in high elliptical orbit at Mars
(e.g., 250 km x 1 sol)

Lunar Orbit

Use direct return to Earth, or
return ship could be staged in low lunar orbit (LLO), but not high elliptical orbit
Interplanetary Mission Modules (IMM)

IMM design

*Mars:* human factors driven; larger volumes
artificial gravity (spinner) or microgravity countermeasures facilities

*Moon:* minimal volume and capabilities (ala Apollo Cmd Module or LEM)

Science

*Mars:* extensive interplanetary science program (astrophysics, solar observatory,
physiological effects, ICE psychosocial)

*Moon:* no interplanetary science (much of the above is accomplished on lunar surface)

Roundtrip travel times

*Mars:*  
400 days (Sprint)  
700 days (Opposition)  
1000 days (Conjunction)

*Moon:* 6-14 days

ECLSS and Resupply

*Mars:* Recycling of water and air considered obligatory

*Moon:* Water loop less closed because hydrated/frozen food resupply? 
No indigenous water. Indigenous O\textsubscript{2} mfg power intensive, hazardous

</table>
Martian vs Lunar Surface as an Experiment Observation Base

- Cosmic dust collection
  - Lunar: excellent; superior to Earth orbit because of lack of man-made orbital debris
  - Mars: unusable because of atmospheric shielding and airborne dust

- Radioastronomy
  - Lunar: requires backside location to avoid interference from terrestrial emissions
  - Mars: relatively low data rate link with Earth, but longer baseline for VLBI

- Optical and IR astronomy
  - Lunar: excellent, especially during lunar night
  - Mars: relatively poor because of atmosphere/dust interferences

- UV and X-ray astrophysical observations
  - Lunar: excellent
  - Mars: poor to non-existent for all but near-UV

- Solar wind observations
  - Lunar: excellent, including study of surface materials for long-term record
  - Mars: not possible from surface

- Cosmic ray and solar flare radiation studies
  - Lunar: excellent
  - Mars: far superior to observations from Earth and LEO, but inferior to Lunar

- Gamma ray astronomy
  - Lunar: excellent
  - Mars: acceptable

* Caveat: the Martian moons – Phobos and Deimos – could provide observational bases with Lunar-like capabilities, but the problems of operations in mid-g environment and at great distance limit their use, except for long baseline comparison studies.
In situ Resources Production (ISRP) on the Moon

- **Oxygen** (Lunar oxygen -- LLOX)
  high temperature or highly chemically reactive processes, from silicates or iron minerals (e.g., ilmenite)

- **Metals**
  aluminum, magnesium, titanium, iron
  (high temperature processes, from silicates)

- **Glass**
  fusion of separated silicates

------------------------------------------
From trace constituents:

- **Sulfur**
  rocket fuel, many other uses

- **Hydrogen**
  rocket fuel, many other needs for base items

- **$^3$He**
  release of solar-wind implanted isotope
  production of solar wind hydrogen as by-product
In situ Resources Production (ISRP) on Mars

- **Water**
  from permafrost ice, surface ice, vapor in atmosphere

- **Oxygen**
  separated from Martian atmosphere (0.13 % constituent), OR
  chemically derived from atmospheric CO₂ (zirconia cell, Bosch, or Sabatier), OR
  electrolysis of H₂O from soil or atmosphere

- **Make-up Gas**
  separated nitrogen (2.7 %) and/or argon (1.6 %) from atmosphere

- **Food**
  plant growth using Martian H₂O and CO₂

- **Propellant Candidates**
  Chemical: CH₄, CO, LOX, N₂H₄, NTO, CO₂
  Nuclear thermal rocket: CO₂, H₂O

- **Metals**
  Magnesium -- from Epsomite (salt molten electrolysis)
  Iron -- from amorphous Fe-oxides, magnetic minerals
  Titanium -- from titanomagnetite, ilmenite

- **Miscellaneous**
  Sulfur; Duricrete; Glass; Salt; MgO; Carbon black

- **Mars Gold**
  Hydrogen Peroxide (H₂O₂) -- from water
Commonality/Differences

Potential Common Hardware

ECLSS: Mars spaceborne + Lunar landed + Space Station
Ascent vehicles: MAV and LAV, except ΔV disparities
EELS (except as noted below)
PVPA: MSS, LLMM, SS

Potential Hardware Differences

Propellants: long-term cryo storage (Mars) vs cryo upper stage (moon)
Interplanetary transfer vehicle (including artificial gravity)
Landing systems: aeroassisted profiles; differing nav implementations
Rover drive-power
Orbital capture: all-propulsive for moon (or, direct landing); aeroassist for Mars
Descent vehicle
Landed ECLSS
Landed power (PVPA/batteries for Mars; nuclear/RFC for moon)
EELS: retropropulsion for high Earth-encounter C3 (from Mars)
Communication systems
LEO assembly fixtures and robotic aids
additional items

( ) Radiation
   ( ) MTV will have consumables which can provide solar storm shelter. LTV will require dedicated shielding or else careful design for equipment locations
   ( ) May be able to forecast SPE-safe period for LTV launches, or at least for the Lunar landers. But Mars launch must go on time
   ( ) GCR is potentially a major problem for MMM, but not for lunar because tours are short, and then can spend most of the time underground

( ) Pressurized rovers are different
   ( ) energy/km because of gravity
   ( ) rad protection -- moon doesn't have the atmos shielding. Need omni-shielding on the lunar pressurized rover (of course, can accommodate more mass because of lower gravity)

( ) Crew members may go several times to moon; Mars crewmembers probably go to Mars only once.

( ) SPE dose situation much different. $1/R^2$ to $1/R^4$ for Mars (con) missions go out, opp missions go inward. Hence, much different possibilities.

( ) SHOULD HAVE a lower gravity test facility in LEO before committing to a Lunar Base, to find the physiological tolerance to $1/6$ gee. If think $1/6$ gee really isn't a problem, then why would you need to go to the moon to simulate a Mars mission?

( ) Lunar vehicles have through-the-brake designs. Mars vehicles do not.

( ) No reactors on the martian surface. Wind transport hazard!
HUMAN MISSIONS TO THE MOON AND MARS: A COMPARISON
Benton C. Clark, Planetary Sciences Laboratory (B0560), Martin Marietta Astronautics, Denver, CO 80201

The Moon and Mars are the solar system bodies most often cited in considering man-tended outposts or permanently occupied bases. Commonality of purpose, hardware, and mission operations seem to provide a basis for cost-savings and accumulating experience that would be applicable to both. It is the purpose of this paper to examine these perceived similitudes. The areas that will be addressed can be categorized into science objectives, environment, engineering systems, operations, and national goals.

Environment. Surface environments are quite different on the moon and Mars -- the one a vacuum with long periods of constant illumination by the sun, then darkness; the other a cold, low pressure gaseous environment with winds and an Earth-like diurnal cycle. Thermal balance, one radiatively dominated and the other with a major convective component, must be handled quite differently at the two locations. The gravitational force is two and one-half times higher on Mars. Both surfaces are dusty, but martian dust, once disturbed, remains suspended for long periods. The present martian atmosphere provides 16 g/cm² shielding overhead against cosmic rays, solar flare particles, and hypervelocity micrometeoroids. The lunar surface is unprotected from all of these. The martian soil and atmosphere contain an abundance of light elements (especially, H, C, N, O, S) and includes both CO₂ and H₂O, the ingredients necessary to grow plants. The moon is impoverished in the light elements, except for O bonded in silicate minerals (which could, in principle, be used to manufacture lunar liquid oxygen, LLOX). Production of metals would probably be quite different on the two bodies because of the apparent availability of salts on Mars, compared with the necessity to use igneous rocks on the moon. A whole host of valuable H-containing commodities can be manufactured on Mars, including hydrogen peroxide, but only with extreme difficulty on the moon.

Engineering systems. Propulsion systems for primary access to the moon and Mars may be significantly different because of delta-V disparities, although tankage stretch options might span the gap. Multiple heavy-lift launch vehicles (HLLVs) will be required just to depot propelant for the Mars mission, but LLOX availability would reduce this load, except for the very marginal payback on export of LLOX to LEO and the demonstrable counterproductive approach of sending the Mars spaceship first to the moon to on-load propelant. Mars missions require long-term cryo-storage (up to 1.5 yr.) in Mars orbit, but Lunar missions require storage for relatively short times (~ weeks), except on the lunar surface. Ascent vehicles might be similar. However, the propelant of choice for Mars is storable bipropellant to avoid problems of storage of cryopropellants in the relatively warm martian atmosphere. For the moon, there is no obvious reason why cryopropellants, with their more mass efficient performance, should not be used for lander and ascent applications. Descent vehicles are expected to be quite unlike because of the anticipated use of aerobraking and possibly also parachutes at Mars. Likewise, orbital insertion will very likely employ aerocapture at Mars, but can only be accomplished by retro-propulsion at the moon. Different communication hardware systems are expected for the two missions as well as the receiver and relay links at Earth. Power supply at the surface can be direct-solar on the moon, but may require nuclear at Mars and for the lunar night. Fission reactors can be vacuum rated (ala SP-100) for the moon, but would be of different design for the martian surface. The use of nuclear power on Mars may actually be forbidden because of the additional complication of widespread redistribution by the winds of any spilled radionuclides. Thermal control designs will be
quite different. Life support systems for Mars would have to be much more power conservative than the high-mass, power-intensive infrastructure most likely available on the moon. Habitats on the moon will require much greater wall thicknesses (more likely, burial under lunar soil) to compensate for the lack of atmospheric shielding against solar flare particle events and micrometeoroid bombardment. Astronauts going to the moon will receive very minor doses from galactic cosmic rays because of the short in-transit exposure time and the massive shielding possible on the lunar surface. Spacesuits and EVA operations will be different in the two locations -- the former because of the weight differential, and the latter because of the danger in long sorties (e.g., one week) because of the radiation and meteoroid hazards just mentioned, and the darkness and excessive cold during the lunar night. Indeed, exploration sorties for more than one week may generally be out of the question.

**Operations.** The round-trip propagation time for communications to the moon is 3 seconds; for Mars, it ranges from 8 to 40 minutes. Mission operation control at the moon can be Earth-based, as in the past; for Mars, the style of mission operations will be entirely different and require greater autonomy for the crew. On the martian surface, the 24.6 hour day/night cycle would dictate most operations and be desynchronized from the day/night at mission control on Earth; on the moon, any cycle can be chosen, but the astronauts will have to cope with the long lunar night. The isolated and confined environment of a Mars-bound crew is different in scope and intensity (especially, length-of-time); rescue for stranded Marsnauts is mostly out of the question. The number of Mars astronauts needed per decade will be about an order of magnitude below that needed for Space Station and Lunar Base. Preparations for a single Mars mission includes many more HLV launches (for propellant) and assembly/checkout in low Earth orbit. Solar flares can be monitored from the Earth's surface and orbit for lunar missions, but require sophisticated on-board instrumentation and expert systems to provide similar monitoring during much of the Mars mission.

**Science objectives.** Geologic exploration will be of high priority on both the moon and Mars, with emphasis on the search for ancient pristine materials and new geologic provinces. In addition to much greater variety in styles of volcanism and the more likely possibility of contemporaneous volcanic or seismic activity, the martian surface has experienced eolian forces and apparently some or all of the effects of liquid water (catastrophic floods, channels, sapping, chemical weathering, sediment deposition) and ice (polar caps, permafrost, thermokarst, glaciation). Mars has an atmosphere, invoking investigations related to weather systems and climatology. A warm, wet paleoclimate leads to the possibility of extant life in oases or relics of extinct life forms (fossils). Mars also has two satellites that deserve thorough study.

Both may be good locations for observational investigations, although the moon would be better for many astronomical observations, cosmic dust collection, and Earth observation. Radio astronomy would benefit from backside location on the moon, to avoid interferences from Earth; Mars would create a longer baseline for VLBI.

**National goals.** International cooperation could be arranged in either case, but is more often invoked for the more ambitious and more politically neutral Mars missions, although the practical difficulties might be more severe. The moon can serve as an Earth-monitoring base. Mars missions specifically require Space Station Freedom involvement, including zero-g physiological countermeasures development and/or artificial gravity research and free-flyer tested support. Lunar missions could involve SSF, but need not. Use as a transportation node for storage, refurbishment, and refueling of lunar vehicles may entail major compromises of scientific objectives and increases in operating costs for Station Freedom.
Colonization is reasonable on Mars because of the abundance of light-element natural resources and the distinct possibility of ore deposits. A settlement on the moon seems difficult because of resource limitations and unnecessary in view of its close proximity to Earth and the possibility of short-notice access for man-tended base management.

Going to Mars would be the first leap by man into deep space -- beyond the gravitational influence of the Earth. No other act is so likely to galvanize world enthusiasm and inspire the youth of our country.

ADVANTAGES

• HIGHEST EFFICIENCY POTENTIAL (35%) @ TEMPERATURE RATIO = 2.0
• COMPACT HEAT TRANSFER ASSEMBLIES
• MODULAR
• ONLY TWO NON-CONTACTING MOVING PARTS
• LONG-LIVED GAS BEARINGS
• ELECTRIC OR HYDRAULIC OUTPUT AVAILABLE
• NO TECHNICAL BARRIERS TO SCALEUP (DEMONSTRATED 3kW TO 25 kW)
• NEARLY CONSTANT TEMPERATURE RADIATOR
• SINGLE PHASE, NON-TOXIC WORKING FLUID (He, H₂)
• LOWEST SPECIFIC MASS POTENTIAL (5kg/kW)

DISADVANTAGES

• LACK OF LONG DURATION EXPERIENCE AT LARGE SCALE
• LOW FREQUENCY (60 - 100 Hz) OUTPUT
• CLOSE TOLERANCES REQUIRED
• BERYLLIUM MOVING PARTS
• HIGH PRESSURE (2000 PSI)
• THEORETICAL UNDERSTANDING OF CYCLE LOSS MECHANISMS IS LIMITED
• EXTRAPOLATION OF TECHNOLOGY TO LARGER SIZES (150 kWe +) UNPROVEN
• HEAT PIPE HEAT INPUT REQUIRES START/RESTART VERIFICATION IN ZERO G
• REFRACTORY/SUPERALLOY ENGINES OPTIMIZE AT 500-600 T<sub>COLD</sub> - REQUIRE Hg RADIATOR IF HEAT PIPE USED

PROPULSION REQUIREMENTS FOR SPACE BEARING OPTIONS - ROLLING ELEMENT

- HIGH STIFFNESS SUPPORT - GOOD ROTOR CLEARANCE CONTROL
- DN LIMITS CAN RESTRICT SHAFT DIAMETERS AND LEAD TO ROTORDYNAMICS PROBLEMS
- LOW DAMPING OF REB ALONE CAN MAKE DYNAMICS MORE SENSITIVE
- EXCELLENT OVERLOAD TOLERANCE
- DN VALUES IN CTV AND NASP TYPE PUMPS ELIMINATE REB
- WEAR WILL ALWAYS BE PRESENT PARTICULARLY IN LOX LEADING TO PERFORMANCE DEGRADATION AS CLEARANCE INCREASES
- CERAMIC BALLS AND IMPROVED CAGE MATERIALS CAN SIGNIFICANTLY REDUCE WEAR AND INCREASE TOTAL BEARING LIFE
NASA SPACE MECHANISMS TECHNOLOGY WORKSHOP
PROPULSION REQUIREMENTS FOR SPACE

BEARING OPTIONS - FLUID FILM

- HIGHER DN LIMITS THAN ROLLING ELEMENT BEARINGS
- HIGH DAMPING CAN RESULT IN IMPROVED ROTOR STABILITY
- LOWER STIFFNESS CAN MAKE ROTOR CLEARANCE CONTROL DIFFICULT
- LESS TOLERANT TO OVERLOADS THAN ROLLING ELEMENT BRGS.
- HIGH SURFACE SPEED RUBS COULD RESULT IN WEAR PROBLEMS IN LONG LIFE APPLICATIONS
- FEED ORIFICE EROSION CAN BE A PROBLEM IN HYDROSTATIC DESIGNS
- WEAR RESISTANT MATERIALS ARE NEEDED TO INCREASE RUB AND START/STOP WEAR TOLERANCE
NASA SPACE MECHANISMS TECHNOLOGY WORKSHOP
PROPULSION REQUIREMENTS FOR SPACE

BEARING OPTIONS - FLUID FILM BEARINGS ISSUES

- IMPROVED TURBULENCE MODELS
- BETTER UNDERSTANDING OF POWER LOSS, HEAT GENERATION, TORQUE
- BEHAVIOR OF COMBINED REYNOLDS NUMBER FLOW
- TWO PHASE PERFORMANCE OF VARIOUS DESIGNS
- RELATIVE PERFORMANCE OF DIFFERENT DESIGNS
  - HYDROSTATIC
  - HYDRODYNAMIC
    - COMPLIANT (FOIL)
    - RIGID SURFACE
  - HYBRID HYDROSTATIC/HYDRODYNAMIC
NASA SPACE MECHANISMS TECHNOLOGY WORKSHOP
PROPULSION REQUIREMENTS FOR SPACE
BEARING OPTIONS - MAGNETIC

ACTIVE:

- HIGH STIFFNESS AND CONTROLLABLE DAMPING PROVIDE UNIQUE
  ROTOR CONTROL OPTIONS
- MAY NEED SUPERCONDUCTING OR HYPERCONDUCTING DESIGNS TO
  ACHIEVE LOAD CAPACITY REQUIRED FOR TURBOPUMPS
- HIGH DN LIMITS SIMILAR TO FLUID FILM BEARINGS
- NEED FOR BACKUP BEARING COULD BE A DISADVANTAGE IN TERMS OF
  ENVELOP REQUIREMENTS
- LONG TERM HYDROGEN EXPOSURE OF MATERIALS MAY BE AN ISSUE
- NEED WEAR RESISTANT SURFACES FOR RUB TOLERANCE

PASSIVE SUPERCONDUCTING:
- LOW STIFFNESS PRECLUDES USE ALONE IN MOST TURBOPUMP
  APPLICATIONS
- CURRENT CRITICAL TEMPERATURES FAVOR USE IN HYDROGEN RATHER
  THAN OXYGEN
- LONG TERM EXPOSURE EFFECTS ON MATERIALS

Introduction
Robotics to date has produced underlying capabilities that enable robots to respond to a variety of task challenges. Robotics is maturing as a discipline, and the investment in prior research has yielded a wealth of technologies for a new generation of competent robots. It is no longer necessary to restrict research to work on testbed robots, since systems that meet performance specifications of end-users can now be developed. Given the existing technology base, robots that were unachievable five years ago now are within reach, provided that performance goals are established and development efforts in the near term are directed to meet them.

With seminal groundwork laid, robotics technology is now evolutionary, not revolutionary. Evolutionary technologies are born of knowledge-based research: efforts aimed at developing a new and better understanding of the application of scientific principles. From failures in early development come the insights that lead to successful future implementations, which show increasing utility and relevance as the technology evolves. Robots that meet new task challenges and exhibit proficiency are feasible, since the knowledge we have gained is allowing us to cross the threshold from pure knowledge-based research to performance-based research.

The Nature of Field Robots
Structured environments, like those found in factory settings, do not challenge robots with the dynamism and uncertainty of unstructured environments. Active and forceful manipulation of objects in unstructured environments requires much more than current industrial robotics can deliver. To work in a field site — say, digging up a gas pipe — a field robot must be able to recognize unknowns and respond to unplanned difficulties. It is paramount that the robot sense events and take responsive actions. Needs of the open work site, like robot intelligence and robustness, drive the agenda for field robotics research.

Robots, in general, fall into three classes, each distinguished by the control procedures available to the robot and its relationship to human supervisors. The first of these classes, programmed robots, perform predictable, invariant tasks according to pre-programmed instructions. Teleoperated robots, the second of these classes, includes machines where all planning, perception, and manipulation is controlled by humans. Cognitive robots, the third class, sense, model, plan, and act to achieve goals without intervention by human supervisors.

Programmed machines are the backbone of manufacturing; preprogramming is extensible to an important class of field work tasks (mostly on the periphery of the field work mainstream, and mostly unenvisioned and untried at this time). Programming commands actions through scripts that are played back by rote with branching of the
script occurring at specified times or in response to anticipated events. Such scripts are only useful for predictable and invariant tasks, limiting the general use of pre-programmed robots for field work.

Teleoperated machines, servoed in real-time by human operators who close the strategic control loop, amplify and project the human. Because all perception, planning, high-level control, and liability rest with the human, teleoperation circumvents the most difficult issues that face other robot control modes, including the liability of passing control between machine and human and coping with unanticipated scenarios.

Teleoperation is proven where man does not tread, where demands are superhuman, where tasks are unstructured (by current measure), where liability is high, and where action is inevitable. A downside of teleoperation is that much is lost in translation across this man-machine interface. Robot bodies and senses are not optimal for coupling to man. Similarly, human minds are not optimal for the control of robots because of limitations in input/output bandwidth, memory structures, and numerical processing. The prospect exists for field robots to outperform their human counterparts in many ways.

Cognitive robots sense, model, plan, and act to achieve working goals. Cognitive robots servo themselves to real-time goals and conditions in the manner of teleoperators but without human controllers; they are their own supervisors. Cognitive robots pursue goals rather than play out scripts; they move toward goals and notions rather than to prescriptions and recipes. Although software driven, they are not programmed in the classical sense. Cognitive robots are perceptive and their actions are deliberate; they operate in the face of the vagaries and contingencies of the world. Task performance by a cognitive robot is responsive to the state of the environment and the robot itself.

Hybrid forms of teleoperated and programmed machines are becoming increasingly attractive as robots. For example, because factory processes are becoming more sophisticated as they integrate preprogramming and sensing, supervisory controllers and sensory feedback with teach/playback are becoming new research goals. Hybrid, supervisory, and programmable robots are also evolving from the roots of teleoperation in the nuclear service and decommissioning industries.

However they are classified, the most striking observation of present-day robots is that, with few exceptions, robots lack the ability to perform with any generality, which is the goal of truly capable systems. Even when task directives and methods of procedure are explicit, unforeseen difficulties arise that impede or halt the robot's progress. Autonomous navigation systems, for example, lack the capacity to negotiate traffic or move quickly across unexplored rough terrain. These robots are often debilitated by uncontrollable circumstances, such as bad lighting and inclement weather. Nor can they always cope with conflicting data to resolve ambiguities. Only now are driving robots
beginning to distinguish shadows from roads and separate real obstacles from the phantoms caused by spurious sensor readings.

The Use of Field Robots

Factory robots bring the repeatability, productivity, and quality control of automated mechanisms to manufacturing industries. The other historical motivation for using robots is to relieve humans of duty in hazardous environments. The nuclear industry was quick to adopt telerobotics so that human presence can be projected into places where the need for radiation protection hinders manual work or precludes it altogether. Teleoperated manipulators are presently saving thousands of man-rem's of exposure in the routine servicing of reactors and associated steam generation equipment; recovery from the Three Mile Island and Chernobyl accidents would not have been possible without robotic worksystems specially commissioned to operate in those scenarios. For their specialized agenda, these nuclear-qualified robots exhibit high competence, owing to the fact that they were built to meet explicit performance goals and design criteria.

The world is now positioned to apply robotic technologies in other commonplace scenarios. Non-factory work sites are ripe, virtually untouched, and inevitable arenas for robotic applications. Labor efficiency on field sites is alarmingly low and the need for improved productivity is evident. Worker time spent idle or doing ineffective work may exceed half the work week, and productivity has generally been in decline for two decades. Thus, industry size, economics, existing inefficiencies, and competition motivate the introduction of robotics to field work. Other motivations include quality assurance and the prospect for better control over the field work site of the future. Further, because field work is often hazardous, concerns for health and safety provide additional impetus for robotic implementations.

In addition to all these motives, certain applications are inevitable because man is not perfectly suited for field work; machines are often better equipped for many applications. Man, for example, is vulnerable to hostilities such as weather, dust, vacuum, submersion, and cave-ins, and limited by a lack of scale or power for activities such as mining, material handling and construction. Man lacks certain sensing modalities, memory structures, and computational abilities that will allow the robots of the future to precisely sense and execute tasks in scaled or measured environments, and optimize automatic material distribution throughout a site. The needs of the field industries drive the development of unstructured robotics just as manufacturing and assembly drove structured robotics and hazardous environments drove teleoperation.

Early applications of robotic arms in manufacturing leveraged on their accuracy, consistency, and repeatability to achieve productivity, performance quantified on the basis of speed and the efficiency of resource investment, particularly the human resource.
Similar increases in productivity are realizable in applications outside the factory. For example, proper characterization of a hazardous waste site requires an enormous amount of data to be taken over a large land area. There are current efforts to automate this process by replacing manual data collection with mobile robots that can acquire and spatially correlate site information. Orders of magnitude increases in the amount of site data, as well as higher precision position estimation, will enable more complete assessments and ultimately reduce the cost of the investigation process.

Excavation is another excellent application to further the evolution of robotics because of its significance in scale and economic importance. It operates on a universal and generic material (soil), and excavation's goal and state can be described adequately by models of geometry and kinetics. Further, excavation is tolerant of imprecision, well-understood as a human driven process, and prototypical of a host of spin-off applications. One motivation for robotic excavation is the hazard in such tasks as blind digging of gas lines, retrieval of unexploded ordnance or removal of hazardous waste from a landfill. Another motivation is the productivity and process control that could be realized in mass earth moving operations. Unmanned excavation will reduce the human injuries and property losses attributed to explosions, decrease operation costs, and increase productivity by lengthening the work day.

Automation of surface mining has the potential to increase safety, decrease cost, and revolutionize control of surface mining operations. Elimination of human operators could circumvent current variables of operator quality and availability and monotony of the task. Further, automation of surface mining is seen as a building block toward general work site automation. Surface mining lends itself well to automation. Driving and haulage are simple actions in comparison with the richness of other robotic tasks like manipulation. Off-road navigation can also be extended to the applications of agriculture and timber harvesting. The environment can be known in advance and rigged to an appropriate level. Because the task is repetitive (the same paths are traversed for years), explicit plans alleviate the need for the robot to explore or learn about its environment. Although it must be able to handle a range of contingencies such as obstacles, an autonomous haulage system is primarily a performer of preplanned actions relegating perceptive sensing to a mechanism of self-survival.

A new generation of robots, grounded in existing robotic technologies, is on the horizon and will find widespread utility.

Robotic navigators are one class of systems that have several applications, including haulage, material delivery, and waste site characterization. Through automation of off-road driving, these tasks can be performed with less direct human involvement, thereby
increasing a worker's productivity through simultaneous control of several vehicles and removing his exposure to potential hazards.

Ground vehicles realizable in the near term will navigate under general lighting and weather conditions at productive rates of travel. Some will drive on streets and highways; others will negotiate rough terrain with variable geometry and natural surface characteristics. They will employ multiple sensory modes for guidance; use maps from several sources and of various resolution; detect, recognize and avoid obstacles; and be cognizant of their own dynamics. Future generations of robotic off-road navigators will focus on the design of robust navigational schemes. Obstacle detection and recognition will be extended to accommodate dynamic obstacles like other vehicles so that these robots will ultimately be capable of driving in traffic.

By coupling manipulation to locomotion, a robotic vehicle that can navigate off-road can be complemented with the ability to perform useful work. A terrestrial robot worksystem can be used in construction applications, such girder emplacement, excavation, and brick laying, and hazardous applications like handling of radiological material, waste packaging, and decontamination and decommissioning of nuclear facilities. These tasks share the common denominators that the robot physically engages and manipulates its environment and that the setting for these operations is often very hazardous.

These steps to enhance teleoperation of the worksystem provide the foundation for enhanced performance through increased task autonomy. The worksystem will evolve incrementally, as operations performed under human control in one generation are automated in the next. Interaction between man and machine will become simpler as the robot becomes able to accept higher level commands, and the human’s role will transition to supervisor.

Next generation worksystems will perform certain subtasks on their own, while the operator exercises direct control for the more difficult operations, monitors subtask execution, and intervenes as needed. In the case of excavation, subtasks might be the scooping and unloading phases of the digging cycle; for building construction, subtasks might include grasping an I-beam and carrying it to location where a building foundation is being established. These capabilities will develop from the basics of manipulator control and geometric model building of the enhanced teleoperator by adding the capacity to recognize objects and the ability to reason on perceived geometry and force. Future generation worksystems will combine subtasks, automate more difficult aspects of the tasks, and add execution monitoring to achieve a higher degree of autonomy. Alternatively, it might be desirable to pursue execution of a variety of tasks using one worksystem with multiple tools and operating modes to achieve higher utility.
The Evolution of Robotic Technology

Robotics research has reached a threshold where technologies are beginning to find performance niches in which their implementations show comparative advantages over older technology or allow the performance of tasks previously unperformable. We are also witnessing a shift in implementation process from ad hoc integrations to disciplined development of complete systems.

Robotic technology has gained competence in the key areas of sensing, cognition, and control, to the point where new applications are feasible. Early robots had only mechatronic sensing with which they measured directly observable external variables, such as displacement and force, and could perform only simple operations, such as inspection, loading, and other positioning tasks. Increased understanding of vision and other sensory processes has made it possible for robots to make interpretations of their environment. Advanced robots extract and recognize certain features in data, often from multiple sensors, on the basis of pre-stored symbolic representations. This makes them capable of more challenging tasks, for example, manipulating irregularly shaped objects and assessing navigability of roads and paths. A very demanding task, like construction of a building, which requires not only the recognition of features and objects, but understanding of their semantic interplay, is presently beyond robotic technology.

Similarly, robots are able to undertake more challenging tasks as a result of advances in machine cognition. For early robots, planning was algorithmic and often no more than continuous state error correction, as in charting and following a trajectory. It is now feasible for robots to perform tasks like shaping soil and walking over rough terrain, which require automatic planning of significantly greater scope and depth: plans must be decomposed from goal specification into executable actions, and plan formulation has to be done in the face of uncertainty, requiring execution monitoring and use of contingencies. Coordination of multiple, potentially conflicting subgoals to fulfill a single, high-level directive, such as "clear obstacles from the road," remain too ambitious for existing robots.

The evolution of robotic technology is also evident in the increasing physical challenges met by robots. The first robots had kinematic control only, and their task domain spanned only operations that could be expressed by prescriptions of robot position. Better understanding of robot mechanisms and the application of more advanced control theory has enabled tasks that involve dynamic interaction of the robot with its environment, like stable walking and excavation. We are now implementing control at the task level, which goes beyond control theory and includes cognitive functions, such as error detection and fault recovery, so that occurrences, such as an unexpected obstacle, a sudden loss of traction, or a dropped payload, do not prevent completion of a task.
Future Directions

Despite evident need and apparent promise, the evolution of field robotics has not been straightforward. Ancient crafts have been historically slow to embrace new technology. Research investment levels have been insignificant. No precedents in field work industries for development programs of the requisite magnitude exist. Because field problems are difficult, quick fixes or one-time solutions are few, running counter to historical insistence on short-term payoff for investment. Obstacles to the growth of field robotics are compounded by the lack of common ground between the field industries and the robotics research community. The industry cannot yet visualize a programmatic course of action for integrating the growing robotic technology with its own.

At this time, construction, subsea, space, nuclear, mining, and military applications are driving and pacing many field robotics developments. Subsea and space applications, in particular, present unique technical challenges to robots, specialized motivations for field work, and constraints and regulations that discourage the use of human workers. However, the formative integration and drive for field robotics must ultimately come from the field work industry itself. The inevitability of field robotics will drive its evolution despite the immediate immaturity and impotence of the field.

It is likely that all three classes of robots and their hybrids will find sustaining relevance. Experiences are too few and it is too soon to resolve the relative importance of these forms or to discount the potential of any form. The Japanese have embraced teleoperators and programmed machines for field work. Perhaps the early American views of field robotics overestimated the need for sensing, artificial intelligence, and autonomy. Though it now appears that attributes of intelligence, particularly the ability to deliberate performance of tasks, will eventually dominate field robotics, nonetheless, teleoperators and programmed machines have both short- and long-term relevance.

If robots eventually prove themselves infeasible for unstructured environments, our views on what constitutes structure must change. Robots other than teleoperators may be irrevocably synonymous with structure. Our judgment in this matter should not be too clouded by current measures of structure and machine perception. It is common to mistake or overestimate chaos in a task environment simply because form and understanding are not apparent. There is a great prospect for structuring the apparently unstructured either by discovering structure or by imposing it.

The evolution of field robots will distill unique attributes for robots with working goals in unstructured environments. New robotic forms will emerge with the capability and the strategic competence to construct, maintain, and demolish. The evolution of field robotics will no more culminate in a single, ultimate form than did its biological counterpart. Rather, classes of robots will emerge for classes of work within classes of constraints.
Even the robot genus/species formed and proven in other application domains remains untested by field work. No doubt most of the forms evolved for other purposes will find relevance somewhere in field work, if only because field works umbrella is so broad. The discipline of field robotics is embryonic. Its maturation is inevitable, but its mature form is not apparent. Given the uncertainty of what robotic forms may be relevant to field work, we argue that the field should remain open to all possible

The discipline must persevere to distill the unique identity and intellectual content of field robotics. The uniqueness of field robotics appears to lie in the cognitive skills and goals specific to the synthesis of an end product. Much research and many goals in field robotics, however, are generic to unstructured robotics, so field work can benefit from parallel developments in related fields. Little applicability would be lost by changing the domain specificity from field work to nuclear, mining, timbering, or military. It seems that field work will be dragged reluctantly to the opportunities of robotics. Nuclear, military, space, and offshore interests are embracing and driving the ideas now. It is essential that field robotics identify and drive the developments that will distinguish it as a discipline of its own.

SPACE MECHANISMS CURRENT OR PERCEIVED OBSTACLES.
SATELLITES AND SPACE PLATFORMS GROUP #1

OBSTACLE: LONG-LIFE CHARACTERISTICS OF LUBRICANTS

TECHNOLOGY DEFICIENCIES (KNOWN OR PERCEIVED)
- Limited acceleration techniques/models
- Inadequate knowledge of surface-lube interactions
- Thin film versus Bulk Properties
- Lack of understanding of failure mechanisms
- Application process deficiencies
- Lack of correlation between surface conditions and life

CURRENT STATE OF ART
- "Seat-of-the-pants"
- Good surface analysis/characterization
- Limited knowledge of lubricant transfer mechanisms (Creep!, et.al.)

APPLICABLE NASA MISSIONS AND NON-NASA MISSIONS
- All

ACTIVE RESEARCH IN THE AREA
- CSCL: Light effort Correlation of lube surface status to lifetime
- Honeywell: Light effort Lube strategy
- NASA LeRC: Medium effort Surface Interactions
- MPB: Small→Med effort High-temp vacuum Lube

TECHNOLOGY NEEDS FOR CURRENT OR FUTURE MISSIONS
- Better understanding of Barrier coatings
- Need a lubrication strategy
SPACE MECHANISMS CURRENT OR PERCEIVED OBSTACLES.
SATELLITES AND SPACE PLATFORMS GROUP #1

OBSTACLE: FAILURE CRITERIA

TECHNOLOGY DEFICIENCIES (KNOWN OR PERCEIVED)
● Monitoring/sensing (telemetry)
● Definition of failure
● Accuracy/sensitivity of test equipment
● Correlation of testing with application
● Inadequate data base

CURRENT STATE OF ART
● Performance oriented versus diagnostic
● Limited data channels/rates
● Remedies limited
● Fragmented data bases

APPLICABLE NASA MISSIONS AND NON-NASA MISSIONS
● All

ACTIVE RESEARCH IN THE AREA
● MPB: Small→Med effort  Lubricant Breakdown
● NRL,Draper: Small effort  Lubricant breakdown detection
● MMC  Small effort  Surface integrity
● Honeywell  "Medium" effort  Fluid Lubricant failure criteria

TECHNOLOGY NEEDS FOR CURRENT OR FUTURE MISSIONS
● Assessment/survey of existing effort/data
● Coordination of existing activities
SPACE MECHANISMS CURRENT OR PERCEIVED OBSTACLES.
SATELLITES AND SPACE PLATFORMS GROUP #1

OBSTACLE: ENVIRONMENTAL FACTORS

TECHNOLOGY DEFICIENCIES (KNOWN OR PERCEIVED)

- Accurate Characterization
- Pressure
- Radiation
- Temperature
- Obsolete Data
- Lack of information exchange
- vibration
- EMC/EMI
- AO
- Orbital debris
- Zero-G

CURRENT STATE OF ART

- Partial simulation - Lack of combined environments
- "Crude" Estimates
- Limited Test Capability

APPLICABLE NASA MISSIONS AND NON-NASA MISSIONS

- Mission Specific - Earth orbit versus interplanetary, etc.

ACTIVE RESEARCH IN THE AREA

- LDEF
- Numerous scientific studies - LANL, NASA, SDIO, etc.

TECHNOLOGY NEEDS FOR CURRENT OR FUTURE MISSIONS

- Develop methods and facilities for combined testing
- Better modeling of environment and effects
OBSTACLE: TESTING STRATEGIES

TECHNOLOGY DEFICIENCIES (KNOWN OR PERCEIVED)
- Inadequate Accelerated testing methods
- Inadequate simulation - Environment, load, motion, geometry
- Inadequate failure criteria

CURRENT STATE OF ART
- Real-time life testing
- Screening versus component-subsystem
- Good analytical capability

APPLICABLE NASA MISSIONS AND NON-NASA MISSIONS
- All

ACTIVE RESEARCH IN THE AREA
- Limited

TECHNOLOGY NEEDS FOR CURRENT AND FUTURE MISSIONS
- Fund/develop qualitative discrimination technique
- Survey of existing capabilities

SPACE MECHANISMS CURRENT OR PERCEIVED OBSTACLES.
PLANETARY SURFACE OPERATIONS GROUP

OBSTACLE: MATERIALS FOR PLANETARY COMPONENTS

TECHNOLOGY DEFICIENCIES (KNOWN OR PERCEIVED)
● Lack of flexible materials for use at high/cold temperatures
● Unknown property changes in materials exposed to the environment (vacuum, dust, radiation, temperature, abrasion, corrosion)
● Unknown storage and non-operational effects on mechanism materials
● Don’t know the types of materials to use!

CURRENT STATE OF ART
● SOA is for short life, low-use mechanisms
● Space qualified materials are for Earth orbit only.

APPLICABLE NASA MISSIONS AND NON-NASA MISSIONS
● MESUR
● ARTEMIS
● Robotic - Precursor
● Discovery Missions

ACTIVE RESEARCH IN THE AREA
● LeRC - Radiator Materials
● Powered solid Research (MTI)

TECHNOLOGY NEEDS FOR FUTURE MISSIONS
● Flexible materials (e.g. belts, cloth, coatings, seals, etc.)
● Improved wear resistant materials
● Definition of performance of materials (stress corrosion, embrittlement)

CONCERNS
● New and/or advanced materials as needed will not be developed when needed
SPACE MECHANISMS CURRENT OR PERCEIVED OBSTACLES.
PLANETARY SURFACE OPERATIONS GROUP

OBSTACLE: INADEQUATE LUBRICATION

TECHNOLOGY DEFICIENCIES (KNOWN OR PERCEIVED)
● No test data for choosing lubricants to use on planetary surfaces
● Lack of low vapor pressure liquid lubricants for planetary surface use
● Lack of adequate lubricants for ceramics and advanced materials
● Lack of low temperature liquid lubricants
● Lack of solid lubricants for air/vacuum, low/high temperature use
● Lack of understanding on what types of seals will be needed to protect lubricants
● Lack of lubricants that can operate in combined environments (lunar, martian)
● Lack of accelerated testing methods
OBSTACLE: INADEQUATE DESIGN PROCESS

TECHNOLOGY DEFICIENCIES (KNOWN OR PERCEIVED)

- Lack of integrated and structured design tools
- Lack of understanding of requirements
- Lack of standard techniques
- Lack of Earth based test-beds for demonstration
- Prejudiced against advanced technology and unwillingness to invest
- Lack NASA/Industry dissemination of data
- Lack of experience in young engineers
- Lack of adequate analytical models for mechanisms design
- Lack of a design manual
- Lack of interdisciplinary efforts in the design phase of mechanisms
- Perception that mechanism development is considered cheap (Better estimates needed)
- Designing for Reliability and lifetime limitation is difficult
- No system to promote utilization or development of Earth Applications
- No Repair or replacement plans
- A need for low cost standardized components (off the shelf) for design and building of mechanisms (cheaper, quicker)
- Lack of commonality among design for moon and Mars
- Limitations on available power could be a problem
- Designs for sealing an unknown
- Lack of drive train component design
- A need to look at non-traditional components and design of components
SPACE MECHANISMS CURRENT OR PERCEIVED OBSTACLES.
PLANETARY SURFACE OPERATIONS GROUP

OBSTACLE: INADEQUATE DESIGN PROCESS

CURRENT STATE OF ART
• Evolving but inadequate for mechanism designs

ACTIVE RESEARCH IN THE AREA
• LeRC - Seal Design/analysis tool
• MSFC - Rolling Element D/A tool
• Lockheed - Computer int. eng. manufacturing
• EPSAT - Environmental power system design

TECHNOLOGY NEEDS FOR CURRENT OR FUTURE MISSIONS
• Common NASA Engineering and Analysis data base
• Effective means of data transmission
• Tools for synthesis, constraint, propagation, documentation, process and analysis)
SPACE MECHANISMS CURRENT OR PERCEIVED OBSTACLES.
PLANETARY SURFACE OPERATIONS GROUP

OBSTACLE: LACK OF ENVIRONMENTAL UNDERSTANDING AND AFFECTS

TECHNOLOGY DEFICIENCIES (KNOWN OR PERCEIVED)
- Lack of definition of the working environment
- Lack of mechanisms that can operate in an abrasive environment
- Lack of information on material/lubricant interaction effects due to moon and Mars environment
- No prior knowledge of dust mitigation techniques
- Lack of understanding of dust impacts for static versus moving parts
- Lack of engineering based precursor missions
- Unknown electrostatic effects of lunar dust
- Unknown tribological effects of high vacuum and dusty environment in non-lubricated rubbing contact
- Unknown environmental tribological effects on lubricated contacts
- No definitions of operating environments are available
- Lack of system generated environmental data

CURRENT STATE OF ART
- Knowledge of LRV, Apollo, etc.
SPACE MECHANISMS CURRENT OR PERCEIVED OBSTACLES.
PLANETARY SURFACE OPERATIONS GROUP

OBSTACLE: LACK OF ADEQUATE TESTING METHODS

TECHNOLOGY DEFICIENCIES (KNOWN OR PERCEIVED)
• Lack of existing test facilities that adequately simulate the lunar environmental conditions
• Lack of test requirements
• Lack of a theory on which to validate test results
• No validity of 1-G testing to predict successful operation on the moon and Mars
• Lack of demonstration missions to detect problems in mechanism operation
• No known test beds
• Lack of planned tribology flight experiments

OBSTACLE: LACK OF HISTORICAL MECHANISM DATA FOR PLANETARY SURFACE APPLICATION

TECHNOLOGY DEFICIENCIES (KNOWN OR PERCEIVED)
• No guidelines or handbooks for planetary surface mechanism design
• No guidelines or handbooks for planetary surface lubricant selection
• Data from previous missions hard to obtain
• Lack of low cost, standardized components for design and building of mechanisms (leads to expensive mechanisms)
• Lack of configuration and performance metrics for mechanisms

   -- HEALTH MONITORING (STORAGE AND TESTING)

(6) LUBRICATION SYSTEMS
   -- DESIGN OF BEARINGS
   -- CONTAMINATION, EFFECT OF TEMPERATURE, PRESSURE, RESUPPLY
   -- WHAT IS BEARING FOR WHEELS, ETC.
   -- GIMBALS FOR NOZZLES

(7) TRANSMISSION DEVICES (POWER TRAINS, BELTS, CHAINS, ARTICULATED DEVICES U-JOINTS)

(8) ADDRESS DESIGN ISSUES UP FRONT FOR TRIBOLOGY CONSIDERATIONS
   -- DESIGN OF BOTH WITH THE TURBOMACHINERY CFD’s
   -- CONCURRENT ENGINEERING
PRIORITIZED LIST OF TECHNOLOGY NEEDS

POWER/PROPULSION

(9) MATERIALS SELECTIONS
   -- FABRICATION VS LUBRICANT SELECTION
   -- NEED FOR CONSIDERATION OF BOTH AS TRIBOLOGY PART
   -- FOCUS ON HOW TO CONSTRUCT THE DATA BASE
   -- LIGHT VERSUS HEAVY CONTACTS, LEAD COATINGS (OLD AND
     SIMPLE MAY BE BEST)
   -- ACCURATE REPRODUCIBLE MOTION
   -- USEFUL HANDBOOK OF MATERIALS, LUBRICANTS, GUIDES

(10) BIG DUMB BOOSTERS
   -- ROBUSTNESS AND RELIABILITY, SOLID AND LIQUIDS
TECHNOLOGY NEEDS CLASSIFIED INTO 3 AREAS

POWER/PROPULSION

(1) TECHNOLOGY BASE

- MATERIALS/FABRICATION
  -- CONSIDERATION OF TRIBOLOGICAL PAIRS AND OPERATING ENVIRONMENT
  -- HOW DO YOU CONSTRUCT THE INTERFACE (FUNCTIONALLY GRADED MATERIALS, COATINGS, ETC.)
  -- LIGHT VERSUS HEAVILY LOADED CONTACTS
- NDE/HEALTH MONITORING/SMART COMPONENTS
  -- ACCEL. LIFE TESTING WITH NEURAL NETS, FUZZY LOGIC EXPERT SYSTEMS
  -- "TRAINING" OF SMART COMPONENTS
  -- BUILDING DATA BASES FOR 20-30 YEAR RELIABILITY
  -- IDENTIFICATION OF FAILURE MECHANISMS
- LUBRICATION SYSTEMS
  -- NEED CLEAN SHEET APPROACH VS (ADD OR UPGRADE)
  -- PARAMETERS ISSUES: TEMPERATURE, PRESSURE, VACUUM, CONTAMINATION, RESUPPLY, MATERIALS, ENGINEERING THE INTERFACE
TECHNOLOGY NEEDS CLASSIFIED INTO 3 AREAS

POWER/PROPULSION

(2) FOCUSED TECHNOLOGY

● PUMPS: TURBO, COMPRESSORS, GENERIC
  -- COMPONENT TYPES: BEARINGS, SEALS, GEARS, LUBE- SYSTEMS, BLADE DESIGNS, ETC.
  -- HIGH POWER DENSITY FOR SSME PUMPS
  -- FUEL COMPATIBILITY ISSUES FOR: SLUSH FLUIDS, H-O STEAM ENGINE (CRYO TO HOT GAS), WET O₂ (O₂ + STEAM + OTHER GASES), LIQUID METALS (Li, NaK, ETC.)
  -- SMART SYSTEMS NEEDED

● ROTATING MACHINERY SYSTEMS
  -- SYSTEMS INTEGRATION APPROACH, TARGET CYCLE & MISSION (e.g. NASP ENGINE/AIRFRAME)
  -- RECIPROCATING/ROTATING (STIRLING/BRAYTON)
  -- SUSPENSION FOR BEARINGS: MAGNETIC, HYDRO_DYNAMIC, FOIL (-STATIC, AND -FILM)

● POWER TRANSMISSIONS, POWER TRAINS DEVICES
  -- ARTICULATING JOINTS
  -- COMPONENT TYPES: GEARS, BELTS, CHAINS, SCREWS, TRACTION DRIVES, μ-ELECTRONICS/SENSORS, AND FEEDBACK LOOPS
TECHNOLOGY NEEDS CLASSIFIED INTO 3 AREAS

POWER/PROPULSION

(2) FOCUSED TECHNOLOGY (CONTINUED)
- UPFRONT ADDRESS OF DESIGN ISSUES
  -- INVOLVE CONTRACTOR/EE DIRECTLY WITH TRIBOLOGIST
  -- NEED FOR HANDBOOK OF MATERIALS FOR DESIGNERS
  -- PROCEEDINGS FOR DESIGNERS VS RESEARCHERS
- TRIBO-DEVICES
- NEURAL NETS, FUZZY LOGIC INTERFACE CONTROLLERS

(3) APPLIED TECHNOLOGY
- SOLAR ARRAY
  -- MISSION DEPENDENT (REQUIREMENTS/LIMITATIONS)
  -- POWER/PROPULSION
  -- SUPPORT DEPLOYMENT, RETRACTION, STORAGE OF ARRAYS
  -- ARTICULATED JOINTS (e.g., ALPHA, BETA ON SPACE STATION)
TECHNOLOGY NEEDS CLASSIFIED INTO 3 AREAS

POWER/PROPULSION

   -- LIQUID METAL - SEALS AND BEARINGS
   -- DEMONSTRATE HARDWARE (PUMPS, ETC.)
(5) 20 YEAR TECHNOLOGY LEAD TIME MANDATES THAT WE START NOW TO ACHIEVE NASA's MARS/MOON MISSIONS
The responses to each objective question (discussed by the four working groups) were tabulated and prioritized according to the number of groups that thought it was an important issue. The following includes tables illustrating those responses and some written comments on each objective question.

**CURRENT SPACE MECHANISMS OBSTACLES**

The two obstacles mentioned by each of the four working groups were (1) deficient testing methods and (2) deficient lubrication technology for mechanisms. These appear to be the two major needs areas.

The problem with testing is that mechanisms are very systems dependent, if one test parameter is changed, one can not verify that a mechanism will operate as reliably or efficiently under the new condition. Thus, one has to ascertain that all possible operational parameters (that the mechanism will encounter) are evaluated. In addition, it is very hard to simulate a space condition in ground based testing. For example, simulating a zero-g, high vacuum environment or a dusty, wide temperature spectrum, high vacuum environment (as will be the case on the moon) is quite difficult.

Since testing involves tribological effects, the effect of atmosphere type is very important. Tests in air should not be performed unless one is absolutely certain this environment will create no unwanted additional effects. When liquid lubrication is involved there are currently no methods for accelerating the testing because the lubrication mechanism is speed dependent. Testing also must take into account vibrational effects caused during the launch of the mechanism and effects due to storage of the mechanism.

Lubrication technology for space applications has not advanced markedly in the last 20 years. The concern is that currently satellites are being put into orbit with the expectation that they will last for longer periods of time and demanding minimal contamination by outgassing of lubricants. Solid lubricants would be ideal, but generally they have limited life. In addition, those that work well in a vacuum usually do not function well in an air environment, and vice versa. New liquid lubricants have been developed with very low vapor pressures, but they have a tendency to break-down under boundary lubrication conditions and thus their life is unreliable. There are other liquid lubricant candidates for space applications, but the problem is that minimal testing has been done for space qualification or the information on them is proprietary. In the propulsion area, lubrication and testing in LOX has been a problem. And for planetary surfaces, we have no experience in operating mechanical equipment in very cold, dusty, high vacuum, or corrosive environments.
The next most mentioned area was a lack of communication or lack of data sharing. Three of the four groups mentioned this. The Aerospace Mechanisms Symposium is held every year by NASA, but it was felt that this symposium dealt more with design issues than with technology issues and was not much benefit in disseminating technology information. Three of the four groups also mentioned mechanism design methods. It was felt that new or innovative methods need to be developed. It remains to be seen how to accomplish this?

Two of the four groups mentioned quality control methods, space environmental effects and mechanisms materials as being obstacles. The current state of tribology is such that the performance of many lubricants is dependent more on how they are applied than on what is applied. Similarly with producing quality bearings, gears, etc. for space applications. It is important that these parts are produced according to specifications, thus good quality control practices are required. It is becoming more difficult to find good suppliers. Not many materials are space qualified for mechanisms applications. Because materials are qualified for structural applications, designers often choose such materials, even though tribologically speaking they are poor choices, they are selected only because they are "space qualified". Space environmental effects on mechanisms and lubricants are, for the most part, indeterminate, especially on the moon or Mars.

The other deficient areas mentioned at least once by one of the groups, were: analytical models, storage methods, unknown failure mechanisms, and consistent funding. Basically there are very few analytical models to predict a mechanisms performance or how long it will operate. There is a lack of information on how storage will affect the performance or endurance of mechanisms. We do not know how many mechanisms fail when tribology problems occur. And finally, it was felt that the key to improving the operation of space mechanisms was to have consistent funding from NASA Headquarters in this area.

**SPACE MECHANISMS TECHNOLOGY NEEDS**

The technology needs that were discussed for the most part parallel the obstacles listed, however, the technology need responses tended desirable specific areas that were not mentioned in the obstacle discussions. Improved lubricating systems and accelerated testing techniques were listed by all groups. Improved component materials was listed by 3 groups although only 2 groups mentioned materials as an obstacle. Two groups mentioned better design processes, knowledge of failure modes and environmental simulation as technology needs. Analytical models, historical data, testing methods, rotating machinery, pumps, solar and nuclear electric, transmissions, and boosters were mentioned by at least one group.
HOW DO WE IMPROVE THE RELIABILITY OF MECHANISMS

The power and propulsion group was the only group that had sufficient time to address the reliability of mechanisms issue, however their responses are very applicable to the other discipline areas. They felt that: (1) a specialist in mechanical components and lubrication should be involved during the conceptual design phase of any project NASA should supply these specialists or have a list of approved specialists. (2) A system incorporating a rigorous systems of checks and balances should be established. (3) All plans should be reviewed by technically competent engineers. (4) NASA needs to maintain a strong in-house capability to guide and direct contractors as well as to develop needed technology. (5) Realistic testing and simulation of the hardware should be conducted. (6) Long term testing is needed to establish and assure a data base. (7) While NASA's overall missions may change, research and technology in key technological disciplines (such as mechanisms) which are important to many programs should be maintained and stabilized. (8) Finally it was felt that we should return to the "Apollo Philosophy".

WHAT SORT OF INFORMATION SHOULD BE IN A SPACE MECHANISMS GUIDELINES HANDBOOK

All the groups felt a space mechanisms guidelines handbook was a good idea. It was also felt that this document should be a "living" document, being continuously updated as new technology and techniques are developed. A large number of items were listed by each group as to the type of information that should be included in this manual. The responses varied somewhat depending upon the discipline and background of the group participants, but everyone agreed that points of contacts or experts in various disciplines was one of the most important items that should be included. The next most important item concerned environmental effects that should be taken into account. Two of the groups suggested that some case histories should be included. The rest of the items mentioned by the groups are listed in the enclosed table.

HOW CAN TECHNOLOGY DEVELOPMENT AND THE DISSEMINATION OF INFORMATION BE IMPROVED

The number one suggestion for improving technology development and the dissemination of information was to establish a lead or central repository. An important consideration that came out of this workshop was that mechanisms technology is very generic. Technology developed for the satellite industry can also be applied to planetary surface operations as well as to power and propulsion problems. It would be beneficial to have one center correlate all the mechanisms work which would apply to all the agency needs. This would reduce costs as well as reduce the duplication of research. It was also felt that regular meetings such as this workshop need to be conducted to foster the exchange of information. It may be possible to have seminars or sessions at engineering conferences that deal with space mechanisms. A number of other items were discussed and they are listed in the enclosed table.
OTHER ISSUES

The groups were also asked to list other issues that they perceived to be important but were not covered in the objective questions given to the groups. Each group tended to have its own issues. The only issue mentioned by two groups was that better military-civilian cooperation is needed in the satellites area. Various areas were discussed ranging from how to advocate a space mechanisms program to very specific technology issues such as the need for smart systems. The issues listed by the groups can be reviewed in the enclosed table.

WHAT NEXT

All four working groups indicated that the first task that should be done in the space mechanisms area is to initiate a space mechanisms handbook. (Note: the production of that handbook is currently underway, being sponsored by Code Q at NASA Headquarters.) The next task that all of the groups agreed upon was that some forum which would permit regular discussions should be established. Three of the groups stated that regular meetings should take place and three said that a permanent advisory committee or working group should be formed. Other items that should be considered include: have cooperative programs, catalog capabilities (personnel and facilities), establish a lead center, have video conferences, develop a newsletter, etc. The table on "What's Next" includes all the items mentioned by the groups.

The Workshop ended with Professor Theo Keith of the OAI outlining a possible plan whereby industry, government and universities could network through OAI to develop educational courses, handbooks, computer databases, etc. (see accompanying figure). Professor Keith also outlined a plan whereby the workshop could lead to a steering group and then to a space mechanisms advisory group to help advocate a program, to form coalitions, form agendas and improve communication between industry, government and universities (see attached figure).

</table>
Over the years, NASA has experienced a number of troublesome mechanism anomalies. Because of this, the NASA Office of Safety and Mission Assurance initiated a workshop to evaluate the current space mechanism state-of-the-art and to determine the obstacles that will have to be met in order to achieve NASA's future missions goals. The workshop was co-sponsored by NASA/Lewis Research Center and the Ohio Aerospace Institute (OAI) and was held at the Holiday Inn in Westlake, Ohio. Seventy experts in the field attend the workshop. The experts identified current and perceived future space mechanisms obstacles. For each obstacle, the participants identified technology deficiencies, the current state-of-the-art, and applicable NASA, DOD, and industry missions. In addition, the participants at the workshop looked at technology needs for current missions, technology needs for future missions, what new technology is needed to improve the reliability of mechanisms, what can be done to improve technology development and the dissemination of information, and what do we do next.
