September 2000
Since its founding, NASA has been dedicated to the advancement of aeronautics and space science. The NASA Scientific and Technical Information (STI) Program Office plays a key part in helping NASA maintain this important role.

The NASA STI Program Office is operated by Langley Research Center, the lead center for NASA’s scientific and technical information. The NASA STI Program Office provides access to the NASA STI Database, the largest collection of aeronautical and space science STI in the world. The Program Office is also NASA’s institutional mechanism for disseminating the results of its research and development activities. These results are published by NASA in the NASA STI Report Series, which includes the following report types:

- **TECHNICAL PUBLICATION.** Reports of completed research or a major significant phase of research that present the results of NASA programs and include extensive data or theoretical analysis. Includes compilations of significant scientific and technical data and information deemed to be of continuing reference value. NASA’s counterpart of peer-reviewed formal professional papers but has less stringent limitations on manuscript length and extent of graphic presentations.

- **TECHNICAL MEMORANDUM.** Scientific and technical findings that are preliminary or of specialized interest, e.g., quick release reports, working papers, and bibliographies that contain minimal annotation. Does not contain extensive analysis.

- **CONTRACTOR REPORT.** Scientific and technical findings by NASA-sponsored contractors and grantees.

- **CONFERENCE PUBLICATION.** Collected papers from scientific and technical conferences, symposia, seminars, or other meetings sponsored or cosponsored by NASA.

- **SPECIAL PUBLICATION.** Scientific, technical, or historical information from NASA programs, projects, and mission, often concerned with subjects having substantial public interest.

- **TECHNICAL TRANSLATION.** English-language translations of foreign scientific and technical material pertinent to NASA’s mission.

Specialized services that complement the STI Program Office’s diverse offerings include creating custom thesauri, building customized databases, organizing and publishing research results . . . even providing videos.

For more information about the NASA STI Program Office, see the following:

September 2000
Summary

The BOREAS Staff Science effort covered those activities that were BOREAS community-level activities or required uniform data collection procedures across sites and time. These activities included the acquisition, processing, and archiving of aircraft navigation/attitude data to complement the digital image data. The level-0 ER-2 navigation data files contain aircraft attitude and position information acquired during the digital image and photographic data collection missions. Temporally, the data were acquired from April to September 1994. Data were recorded at intervals of 5 seconds. The data are stored in tabular ASCII files.

Note that the level-0 ER-2 navigation data are not contained on the BOREAS CD-ROM set. An inventory listing file is supplied on the CD-ROM to inform users of the data that were collected. See Section 15 for information about how to acquire actual level-0 ER-2 navigation data.

1. Data Set Overview

1.1 Data Set Identification
BOREAS Level-0 ER-2 Navigation Data

1.2 Data Set Introduction
The BOREal Ecosystem-Atmosphere Study (BOREAS) Staff Science effort covered those activities that were BOREAS community-level activities or required uniform data collection procedures across sites and time. These activities included the acquisition, processing, and archiving of aircraft navigation/attitude data to complement the digital image data.
1.3 Objective/Purpose
The ER-2 navigation data set consists of navigation parameters gathered by the aircraft's onboard systems in support of the payload instruments. The purpose of the data is to provide general aircraft positioning information and aircraft attitude information during data collection activities.

1.4 Summary of Parameters
The data include times and georeferencing information that can be used to determine temporal and spatial coordinates associated with each measurement collected from the onboard instruments.

1.5 Discussion
The ER-2 navigation data set consists of navigation parameters gathered by the aircraft's onboard systems in support of the payload instruments. It includes times and georeferencing information that can be used to determine temporal and spatial coordinates associated with each measurement collected from the above instruments.

1.6 Related Data Sets
- BOREAS Level-0 ER-2 Aerial Photography
- BOREAS Level-0 OOCI Imagery: Digital Counts in BIL Format
- BOREAS Level-0 Daedalus TMS Imagery: Digital Counts in BIL Format
- BOREAS RSS-18 Level-1B AVIRIS Imagery: At-sensor Radiance in BIL Format

3. Theory of Measurements

The National Aeronautics and Space Administration (NASA) at Ames Research Center (ARC) maintains a variety of aircraft and sensor systems dedicated to support of remote sensing research. Among these is the Lockheed ER-2 (U-2R). The ER-2 has carried the Moderate-Resolution Imaging Spectrometer (MODIS) Airborne Simulator (MAS), the Multispectral Atmospheric Mapping Sensor (MAMS), the Airborne Visible and Infrared Imaging Spectrometer (AVIRIS), the Thematic Mapper Simulator (TMS), the Airborne Ocean Color Imager (AOCI), and the Thermal Infrared Multispectral Scanner (TIMS). For the BOREAS project, the TMS, AOCI, and AVIRIS sensors flew aboard the ER-2.

Navigation parameters provided by the Litton LTN-92 Inertial Navigation System (INS) includes latitude/longitude, altitude, air speed, pitch, roll, heading, wind speed and direction, and static air temperature. The data were recorded in 5-second intervals.

4. Equipment

4.1 Sensor/Instrument Description

4.1.1 Collection Environment

The INS on the ER-2 is a Litton LTN-92. The LTN-92 comprises three separate units: the Inertial Navigation Unit (INU), the Control/Display Unit (CDU), and the Mode Select Unit (MSU). Three 28-cm ring laser gyros and a triad of force rebalanced accelerometers make up the LTN-92’s instrument cluster. The system accepts Area Navigation (RNAV), Global Positioning System (GPS), or manual position updates, plus INS mixing for improved performance. The Litton Web site (http://www.littoncorp.com/html/newsflash/06_14_97.htm) can be referenced for more information.

The system operates by sensing accelerations from a gyro-stabilized, all-attitude platform. This information is integrated by a digital computer to provide an indication of present position (latitude and longitude), attitude data (pitch and roll), and course line computation referenced to great circle routes. The ER-2 has no room for auxiliary personnel; the LTN-92 INU, the instrument control panel, and the temperature and pressure units are directly connected to the data recorder in the payload area.

4.1.2 Source/Platform

The NASA ER-2 is a high-altitude, single-pilot aircraft based at ARC in Moffett Field, CA, and is deployed globally in support of a variety of atmospheric research projects. It has a maximum altitude of 70,000 feet (21 km), a range of 3,000 nautical miles, a maximum flight duration of 8 hours (nominal 6.5 hours), and a top speed of 410 knots true air speed. The aircraft accommodates about 2,700 pounds of payload and offers the following science support systems:

- Inertial navigation
- Satellite NBS Time Code receiver
- Navigation data recording system
- Real-time telemetry data link

4.1.3 Source/Platform Mission Objectives

For BOREAS, the primary ER-2 mission objective was to collect various Earth surface data in coordination with satellite overpasses for data verification and integration studies. A secondary objective was to collect data at key times when the satellites were not within range of specific sites. The ER-2 was based in Spokane, WA, and could be deployed from there to take advantage of anticipated good data collection conditions. The navigation data provide in-flight geographic location and attitude information for the onboard sensors.
4.1.4 Key Variables
The key parameters used by BOREAS Information System (BORIS) staff and investigators are geographic location, time, platform attitude, altitude, aircraft pitch and roll, and temperature in proximity to the aircraft.

4.1.5 Principles of Operation
The INS on the ER-2 operates by sensing accelerations from a gyro-stabilized, all-attitude platform. This information is integrated by a digital computer to provide an indication of present position (latitude and longitude), attitude data (pitch and roll), and course line computation referenced to great circle routes.

4.1.6 Sensor/Instrument Measurement Geometry
Aboard the ER-2, navigation parameters are recorded at 5-second intervals. The data buffer servicing the navigation recorder samples the particular parameter between records, but is precisely correct only at some point between records. Each parametric measurement is recorded as a count in a 16-bit word; consequently, the conversion of that count to an engineering unit defines the precision. The precision of each measurement is tabulated below.

<table>
<thead>
<tr>
<th>Parameter</th>

</tbody>
</table>

The accuracy of the X-Y-Z position as recorded by the navigation system is limited by the frequency and accuracy of the Tactical Air Navigation (TACAN)-based updates to the inertial system and the accuracy of the recorded altitude. In the conterminous United States, updates occur frequently and are based on strong relative geometry because of the density of TACAN stations, resulting in errors of less than 0.1 nautical mile in X and Y (less error than the precision of the recording system). Altitude is based on barometric pressure with standard pressure defined as 29.92 inches of mercury. Consequently, the actual altitude above mean sea level will vary with current atmospheric conditions and the actual altitude above terrain with the terrain elevation.
4.1.7 Manufacturer of Sensor/Instrument
ARC personnel built the navigation data recorder specifically for NASA’s ER-2 fleet.

LTN-92 INU
Litton Industries, Inc.
Woodland Hills, CA 91367-6675

4.2 Calibration

4.2.1 Specifications
None given.

4.2.1.1 Tolerance
None given.

4.2.2 Frequency of Calibration
None given.

4.2.3 Other Calibration Information

5. Data Acquisition Methods

The ER-2 has no room for auxiliary personnel; the LTN-92 INV, the GPS, the instrument control panel, and the temperature and pressure units are connected to the payload area by RS232 and Aeronautical Radio, Inc. (ARINC) 429 data buses.

Data are recorded serially as a flux change on both track 1 and track 2, with a flux change on track 1 representing a logic one and a flux change on track 2 representing a logic zero. Data words are grouped with 16 bits per word and are separated by a three-step gap in which no flux changes occur on either track. After 1316-bit words (or up to 21 words, depending upon how many analog channels have been recorded), a 12-bit end-of-file gap is recorded (no flux changes). The order of words is as follows:

<table>
<thead>
<tr>
<th>WORD</th>
<th>DESCRIPTION</th>
</tr>
</thead>
<tbody>
<tr>
<td>Serial Number, Flags, Julian Date</td>
<td>Clock</td>
</tr>
<tr>
<td>Latitude</td>
<td>Longitude</td>
</tr>

<td>E-W Velocity</td>
</tr>
<tr>
<td>True Heading</td>
<td>Ground Speed (valid data only with standard INS)</td>
</tr>
<tr>
<td>True Air Speed</td>
<td>Vertical Velocity (valid data only with high-resolution INS)</td>
</tr>
<tr>
<td>Altitude</td>
<td>Pitch</td>
</tr>
<tr>
<td>Roll</td>
<td>14-21 Analog Inputs (optional)</td>
</tr>
</tbody>
</table>

For more detailed information on the Cassette Data Format see Guillot, 1985.
6. Observations

6.1 Data Notes
None. Pertinent in-flight comments are recorded in the digital data records.

6.2 Field Notes
Flight summary reports and verbal records on videotapes are available from the ER-2 flights.

7. Data Description

7.1 Spatial Characteristics

7.1.1 Spatial Coverage
The BOREAS level-0 ER-2 navigation data were collected primarily as the ER-2 flew over portions of the Southern Study Area (SSA) and the Northern Study Area (NSA) during its image data acquisition missions. The SSA and the NSA are located in the southwest and northeast portions of the overall BOREAS region. Some navigation data exist in the data set that cover the BOREAS transect area between the SSA and NSA and areas outside the BOREAS region.

The North American Datum of 1983 (NAD83) corner coordinates of the SSA are:

<table>
<thead>
<tr>
<th></th>
<th>Latitude</th>
<th>Longitude</th>
</tr>
</thead>
<tbody>
<tr>
<td>Northwest</td>
<td>54.321 N</td>
<td>106.228 W</td>
</tr>
<tr>
<td>Northeast</td>
<td>54.225 N</td>
<td>104.237 W</td>
</tr>
<tr>
<td>Southwest</td>
<td>53.515 N</td>
<td>106.321 W</td>
</tr>
<tr>
<td>Southeast</td>
<td>53.420 N</td>
<td>104.368 W</td>
</tr>
</tbody>
</table>

The NAD83 corner coordinates of the NSA are:

<table>
<thead>
<tr>
<th></th>
<th>Latitude</th>
<th>Longitude</th>
</tr>
</thead>
<tbody>
<tr>
<td>Northwest</td>
<td>56.249 N</td>
<td>98.825 W</td>
</tr>
<tr>
<td>Northeast</td>
<td>56.083 N</td>
<td>97.234 W</td>
</tr>
<tr>
<td>Southwest</td>
<td>55.542 N</td>
<td>99.045 W</td>
</tr>
<tr>
<td>Southeast</td>
<td>55.379 N</td>
<td>97.489 W</td>
</tr>
</tbody>
</table>

7.1.2 Spatial Coverage Map
Not available.

7.1.3 Spatial Resolution
Spatial resolution is not strictly applicable to ER-2 navigational data. The sampling rate for each portion of the navigation data can be combined with aircraft position, speed, and altitude to derive a spatial component for each data sample. However, because of the 5-second duration between each navigation parameter, interpolating the navigation data to specific lines in the image data may have limited usefulness.

7.1.4 Projection
The BOREAS level-0 ER-2 navigation data contain latitude and longitude coordinates in the parameter set. Although the latitude and longitude coordinates could be used to calculate coordinates for any map projection, BORIS staff did not assess their accuracy and therefore cannot make any statements about their validity.
7.1.5 Grid Description
Not applicable.

7.2 Temporal Characteristics

7.2.1 Temporal Coverage
The data were collected during BOREAS' Focused Field Campaign (FFC) and three Intensive Field Campaigns (IFCs), covering the period from 19-Apr-1994 through 17-Sep-1994. The ER-2 collected various image data sets over the BOREAS sites in 1996, but no navigation data were delivered to BORIS.

7.2.2 Temporal Coverage Map

<table>
<thead>
<tr>
<th>IFC#</th>
<th>Dates</th>
</tr>
</thead>
<tbody>
<tr>
<td>IFC-1</td>
<td>23-May-1994 -- 08-Jun-1994</td>
</tr>
<tr>
<td>IFC-3</td>
<td>08-Sep-1994 -- 17-Sep-1994</td>
</tr>
</tbody>
</table>

7.2.3 Temporal Resolution
All of the parameters in the navigation data were collected at intervals of 5 seconds.

7.3 Data Characteristics

7.3.1 Parameter/Variable
A listing of the navigation data file parameters is given in Section 8.2. The parameters contained in the inventory listing file on the CD-ROM are:

<table>
<thead>
<tr>
<th>Column Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>SPATIAL COVERAGE</td>
</tr>
<tr>
<td>DATE_OBS</td>
</tr>
<tr>
<td>START_TIME</td>
</tr>
<tr>
<td>END TIME</td>
</tr>
<tr>
<td>ER2 MISSION ID</td>
</tr>
<tr>
<td>CRTFCN_CODE</td>
</tr>
</tbody>
</table>

7.3.2 Variable Description/Definition
A detailed description of the navigation data parameters is given in Section 8.2. The parameters in the CD-ROM inventory listing are:

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SPATIAL COVERAGE</td>
<td>The general term used to denote the spatial area over which the data were collected.</td>
</tr>
<tr>
<td>DATE_OBS</td>
<td>The date on which the data were collected.</td>
</tr>
<tr>
<td>START_TIME</td>
<td>The starting Greenwich Mean Time (GMT) for the data collected.</td>
</tr>
<tr>
<td>END_TIME</td>
<td>The ending Greenwich Mean Time (GMT) for the data collected.</td>
</tr>
<tr>
<td>ER2 MISSION ID</td>
<td>The mission identifier assigned to the ER2 mission in the form of YY-DDD where YY is the last two digits of the fiscal year, and DDD is the deployment number. An example would be 94-120.</td>
</tr>
</tbody>
</table>
7.3.3 Unit of Measurement
A detailed description of the navigation data parameter units is given in Section 8.2. The measurement units for the parameters contained in the inventory listing file on the CD-ROM are:

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Units</th>
</tr>
</thead>
<tbody>
<tr>
<td>SPATIAL_COVERAGE</td>
<td>[none]</td>
</tr>
<tr>
<td>DATE_OBS</td>

</tr>
</tbody>
</table>

7.3.4 Data Source
A detailed description of the navigation data files and their content is given in Section 8.2. The sources of the parameter values contained in the inventory listing file on the CD-ROM are:

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Data Source</th>
</tr>
</thead>
<tbody>
<tr>
<td>SPATIAL_COVERAGE</td>
<td>[Constant software parameter value]</td>
</tr>
<tr>
<td>DATE_OBS</td>

<td>PRE</td>
<td>None</td>
<td>None</td>
<td>None</td>
<td>None</td>
<td>None</td>
</tr>
</tbody>
</table>

Minimum Data Value -- The minimum value found in the column.
Maximum Data Value -- The maximum value found in the column.
Missing Data Value -- The value that indicates missing data. This is used to indicate that an attempt was made to determine the parameter value, but the attempt was unsuccessful.
Unreliable Data Value -- The value that indicates unreliable data. This is used to indicate an attempt was made to determine the parameter value, but the value was deemed to be
Below Detect Limit -- The value that indicates parameter values below the
instruments detection limits. This is used to
indicate that an attempt was made to determine the
parameter value, but the analysis personnel determined
that the parameter value was below the detection
limit of the instrumentation.

Data Not Collected -- This value indicates that no attempt was made to
determine the parameter value. This usually
indicates that BORIS combined similar but
not identical data sets into the same data base table
but this particular science team did not
measure that parameter.

Blank -- Indicates that blank spaces are used to denote that type of value.
N/A -- Indicates that the value is not applicable to the respective column.
None -- Indicates that no values of that sort were found in the column.

7.4 Sample Data Record
A sample data record for the level-0 ER-2 navigation data is not available here. The following are
the records from the level-0 ER-2 navigation data inventory table on the CD-ROM:

8. Data Organization

8.1 Data Granularity
The smallest unit of level-0 ER-2 navigation data is all the ER-2 navigation information collected
during the ER-2 flights over the BOREAS areas. All nine of the data files are in a single tar file on a
single tape for distribution.

8.2 Data Format(s)
The CD-ROM inventory listing file consists of numerical and character fields of varying length
separated by commas. The character fields are enclosed with single apostrophe marks. There are no
The data are contained in a single tar file and after extraction (tar -xvf) can be seen correctly if unblocked using a block size of 150. (dd if=in_fn ibs=150 cbs=150 obs=150 conv=unblock of=out_fn).

9. Data Manipulations

9.1 Formulae
None.

9.1.1 Derivation Techniques and Algorithms
None.

9.2 Data Processing Sequence

9.2.1 Processing Steps
BORIS staff processed the level-0 ER-2 navigation data by extracting pertinent header information from the navigation file and loading the online data base with needed information.

9.2.2 Processing Changes
ARC applied no special or additional processing to the ER-2 navigation data from BOREAS.

9.3 Calculations

9.3.1 Special Corrections/Adjustments
ARC made no special adjustments or offsets to the data.

9.3.2 Calculated Variables
ARC made no special adjustments or offsets to the data.

9.4 Graphs and Plots
None.

10. Errors

10.1 Sources of Error
The data buffer servicing the navigation recorder samples the particular parameter between records, but is precisely correct only at some point between records. Each parametric measurement is recorded as a count in a 16-bit word; consequently the conversion of that count to an engineering unit defines the precision.

10.2 Quality Assessment

10.2.1 Data Validation by Source
Data distribution to NASA ARC occurs at the conclusion of the deployment. Data tapes are presented in total for documentation and archive. Data evaluation consists primarily of identifying component failure (i.e., radar altitude, GPS values, and pressure measurements).

10.2.2 Confidence Level/Accuracy Judgment
The quality of the data is judged to be good.
10.2.3 Measurement Error for Parameters
   See Sections 4.1.6 and 8.2.

10.2.4 Additional Quality Assessments
   BORIS staff imported selected navigation files into a spreadsheet and graphed the values to check for reasonableness.

10.2.5 Data Verification by Data Center
   BORIS staff reviewed the contents of the data files for consistency and used portions of the information to inventory and describe the data in the relational data base.

11. Notes

11.1 Limitations of the Data
   None.

11.2 Known Problems with the Data
   None.

11.3 Usage Guidance
   The tar file should be copied from tape to disk. All nine ASCII files are contained in a single tar file and should be extracted (tar -xvf filename). Each file should then be placed into 150-byte records. This can be accomplished by the UNIX command dd:

   dd if=nav.94-123 of=filename ibs=150 cbs=150 obs=150 conv=unblock

   The files will then appear as 19 ASCII columns with a 5-line header.

11.4 Other Relevant Information
   Not applicable.

12. Application of the Data Set
   The ER2 navigation data could be used: 1) To possibly improve the positional location of the aircraft scanner data and 2) As inputs to software for automated geometric and geographic correction of the aircraft scanner data. As a word of caution, the accuracy and precision of these data are not as well known as those from the C130 aircraft and in addition, it is not known if the frequency of navigation observations is sufficient to properly correct distortions in the scanner data.

13. Future Modifications and Plans
   No modification is planned for the ER-2 navigation data currently logged in the BORIS data base.

14. Software

14.1 Software Description
   The UNIX dd command is useful in placing the new-line characters in the correct place so that the ASCII file appears correctly. See Section 11.3. BORIS staff developed software to extract needed information from the data files and inventory the ER-2 navigation data in the relational data base.
14.2 Software Access
The software developed by BORIS staff can be obtained by contacting BORIS personnel or the ORNL DAAC.

15. Data Access
The level-0 ER-2 navigation data are available from the Earth Observing System Data and Information System (EOSDIS) Oak Ridge National Laboratory (ORNL) Distributed Active Archive Center (DAAC).

15.1 Contact Information
For BOREAS data and documentation please contact:

ORNL DAAC User Services
Oak Ridge National Laboratory
P.O. Box 2008 MS-6407
Oak Ridge, TN 37831-6407
Phone: (423) 241-3952
Fax: (423) 574-4665
E-mail: ornldaac@ornl.gov or ornl@eos.nasa.gov

15.2 Data Center Identification
Earth Observing System Data and Information System (EOSDIS) Oak Ridge National Laboratory (ORNL) Distributed Active Archive Center (DAAC) for Biogeochemical Dynamics
http://www-eosdis.ornl.gov/

15.3 Procedures for Obtaining Data
Users may obtain data directly through the ORNL DAAC online search and order system [http://www-eosdis.ornl.gov/] and the anonymous FTP site [ftp://www-eosdis.ornl.gov/data/] or by contacting User Services by electronic mail, telephone, fax, letter, or personal visit using the contact information in Section 15.1.

15.4 Data Center Status/Plans
The ORNL DAAC is the primary source for BOREAS field measurement, image, GIS, and hardcopy data products. The BOREAS CD-ROM and data referenced or listed in inventories on the CD-ROM are available from the ORNL DAAC.

16. Output Products and Availability

16.1 Tape Products
The BOREAS level-0 ER-2 navigation data can be made available on 8-mm, Digital Archive Tape (DAT), or 9-track tapes at 1600 or 6250 Bytes Per Inch (BPI).

16.2 Film Products
Color aerial photographs and video records were made during data collection. The video record includes aircraft crew cabin intercom conversations and an audible tone that was initiated each time the sensors were triggered. The BOREAS data base contains an inventory of available BOREAS aircraft flight documentation, such as flight logs, videotapes, and photographs.
16.3 Other Products
Although the inventory is contained on the BOREAS CD-ROM set, the actual level-0 ER-2 navigation data are not. See Section 15 for information about how to obtain the data.

When using these data, please include the following acknowledgment as well as citations of relevant papers in Section 17.2:

The BOREAS level-0 ER-2 navigation data were collected and processed from the original aircraft tapes by personnel of the Medium Altitude Aircraft Branch at NASA ARC. BORIS staff reviewed, repackaged, and documented the data received from ARC into the current product. The contributions of ARC and BORIS staff to enhancing and checking this data set are greatly appreciated.

### Abstract
The BOREAS Staff Science effort covered those activities that were BOREAS community-level activities or required uniform data collection procedures across sites and time. These activities included the acquisition, processing, and archiving of aircraft navigation/attitude data to complement the digital image data. The level-0 ER-2 navigation data files contain aircraft attitude and position information acquired during the digital image and photographic data collection missions. Temporally, the data were acquired from April to September 1994. Data were recorded at intervals of 5 seconds. The data are stored in tabular ASCII files.
