Clinical data are provided by
Outline of Talk

- Introduction / Motivation
- Mechanical Heart Assist Devices
  - Computational Issues and Requirements
  - Pulsatile Device
  - Axial Flow Pump
- Computational Technology for Rocket Pump
  - Flow Solver Development
  - Flow Simulation Procedure for Rocket Pump
- Computational Approach for VAD Development
  - CFD Applications to Blood Pump Design
- Summary and Discussion

Mechanical Assist Devices

- Motivation

  - Over 5 million Americans and 20 million people worldwide suffer from Congestive Heart Failure (CHF)

  - CHF patients are still treated with drug therapy, however, at late stage heart transplantation is traditionally the only treatment hope
Mechanical Assist Devices

- Motivation
  - Need for assist devices is very high
    Need : 25,000-60,000 / YR
    Donor hearts available : 2,000-2,500 / YR
    (e.g. more than 4,000 patients were on the waiting list in 1999)
  - Need to find right match
  - Heart pump or VAD, for ventricular assist device, is being used as a temporary support to sick ventricle
    "BRIDGE-TO-TRANSPLANT"

- VAD vs Drug treatment,
  recent study suggests that
  - Survival rate for VAD patients vs for patients receiving drug treatment
    After 1 year 52% vs 24.7% (it also depends on the methods and drugs used)
    After 2 years 22.9% vs 8.1%
  - Some patients who stayed in ICU because of short of breath can walk a block after 1 year assisted by VAD
Mechanical Assist Devices

• Motivation:
  - VAD vs Drug treatment
    • However, complication rate for VAD is 2.35 times higher than that for drugs
    
    Complications include infections, bleeding, and mechanical malfunctions like motor failure, deformed tube and worn bearings
  
  → Design improvements are needed to lower the risk, and possibly to use it as a permanent therapy (long-term device)

"BRIDGE-TO-RECOVERY"

Mechanical Heart-Assist Devices

• Heart Valves

• Ventricular Assist Device (VAD)

  Pulsatile Pump
  - Piston Driven: Low speed, Bulky
  - Pneumatically Driven: Need external support equipment

  Rotary Pump
  - Axial Flow Pump: High speed, Small

  ⇒ DeBakey VAD is based on this concept

• Total Artificial Heart
Requirements

- Simplicity and Reliability
- Small size for ease of implantation
- Supply 5 liter/min of blood against 100 mmHg pressure
- High pumping efficiency to minimize power requirements
- Minimum Hemolysis and Thrombus Formation
Computational Issues

- Geometry / grid definition
  Moving boundary

- Solver
  Time accurate solver

- Physical modeling
  Newtonian vs non-Newtonian
  Turbulence

- Experimental & clinical data

Solver: Viscous Incompressible Flow

- Formulation
  Can be viewed as a limiting case of compressible flow where the flow speed is insignificant compared to the speed of sound (Preconditioned compressible N-S eq.)
  ⇒ Artificial compressibility approach
    - Artificial Compressibility Method (Chorin, 1967)
      INS3 family of codes
      Merkle et. al
      ... many more
  Or truly incompressible
  ⇒ Pressure projection approach
    - MAC (Harlow and Welch, 1965)
    - Fractional Step Method (Chorin, 1968; Yanenko, 1971; Marchuk, 1975...)
    - SIMPLE type Pressure Iteration (Garett et al., 1972; Patanka & Spalding, 1972...)
  ⇒ Use derived variables
    - Vorticity-Velocity (Fasel, 1976; Dennis et al., 1979; Hafez et al., 1988
    - Stream function-vorticity
Artificial Compressibility Method

- Formulation
  \[ \frac{1}{\beta} \frac{\partial p}{\partial t} + \frac{\partial u_i}{\partial x_i} = 0 \]
  - Introduces hyperbolic behavior into pressure field.
  - Speed of pressure wave depends on the artificial compressibility parameter, \( \beta \).
  - The equations are to be marched in a time like fashion until the divergence of velocity converges to zero.
  - Relaxes incompressibility requirement.
  - Time variable during this process does not represent physical time step.

For time-accurate solutions
- Iterate the equations in pseudo-time level for each time step until incompressibility condition is satisfied.
  - Efficient sub-iteration is the key for success

Artificial Compressibility Method (INS3D-UP)

- Time accuracy is achieved by subiteration
  - Discretize the time term in momentum equations using second-order three-point backward-difference formula
    \[ \frac{3q'''' - 4q''' + q'''}{2\Delta t} = -(rhs)'''' \]
  - Introduce a pseudo-time level and artificial compressibility,
  - Iterate the equations in pseudo-time for each time step until incompressibility condition is satisfied.
    \[ \frac{1}{\Delta t} (p^{n+1} - p^{n+1}) = -\beta q^{n+1} \]
    \[ \frac{1.5}{\Delta t} (q^{n+1} - q^{n+1}) = -(rhs)^{n+1} - 3q^{n+1} - 4q^{n+1} + q^{n+1} \]

- Code performance
  - Computing time: 50-120 ms/grid point/iteration (on C90 single cpu)
  - Memory usage: Line-relaxation 45 words/grid point
    GMRES-ILU(0) 220 words/grid point
Pressure Projection Method (INS3D-FS)

- Approach in generalized coordinates
  - Finite volume discretization
  - Accurate treatment of geometric quantities
  - Dependent variables - pressure and volume fluxes
  - Implicit time integration
  - Fractional step procedure
    - Solve auxiliary velocity field first,
    - then enforce incompressibility condition by solving a Poisson equation for pressure.

- Code performance
  - Computation time: 80 ms/grid point/iteration (on C90 single cpu)
  - Memory usage: 70 words/grid point

Pressure Projection Method

- Fractional-step
  - Solve for the auxiliary velocity field, using implicit predictor step:
    \[
    \frac{1}{\Delta t} (u^{'\prime} - u^\prime) = -\nabla p^\prime + h(u^\prime)
    \]

  - The velocity field at time level (n+1) is obtained by using a correction step:
    \[
    \frac{2}{\Delta t} (u^\prime - u^{'\prime}) = -\nabla p^{'\prime} + h(u^{'\prime}) - \nabla p^\prime + h(u^\prime)
    \]

  - The incompressibility condition is enforced by using a Poisson equation for pressure \( p^\prime = p^{''\prime} - p^\prime \)
    \[
    \nabla \cdot p^\prime = \frac{2}{\Delta t} \nabla \cdot u^{'\prime}
    \]
History of INS3D Development

- Code
  - 1982-1987: Original version
    - (Kwon, Chang)
  - 1988-1997: INS3D-UP
    - (Rogers, Kiris, Kwak)
  - INS3D-LU
    - (Yoon, Kwak)
  - INS3D-FS
    - (Rosenfeld, Kiris, Kwak)
  - 1998-Parallel version
    - (Kiris, Kwak)

- Applications
  - SSME Phase II+ HGM Redesign
  - Inducer
  - Impeller
  - Turbopump
  - Flight engines
    - SSME Phase II+ HGM Redesign
  - DeBakey/NASA VAD, 1998
  - Advanced pump

Current Challenges

- Challenges where improvements are needed
  - Time-integration scheme, convergence
  - Moving grid system, zonal connectivity
  - Parallel coding and scalability

- As the computing resources changed to parallel and distributed platforms, computer science aspects become important such as
  - Scalability (algorithmic & implementation)
  - Portability, transparent coding etc.

- Computing resources
  - "Grid" computing will provide new computing resources for problem solving environment
  - High-fidelity flow analysis is likely to be performed using "super node" which is largely based on parallel architecture
Parallel Implementation of INS3D

- INS3D-MPI
  (coarse grain)
  T. Faulkner & J. Dacles

- INS3D-MPI / Open MP
  MPI (coarse grain) + OpenMP (fine grain)
  Implemented using CAPO/CAPT tools

Impeller
- 6 long blades / 6 medium blades / 12 short blades
- 60 Zones / 19.2 M Grid Points

Diffuser
- 23 Blades
- 31 Zones
- 8.6 M Points

- Major Technical Issues
  - Pump codes exist, mostly in rotational frame of reference, for quick design analysis
  - Fully 3-D, transient capability is needed to advance pump technology

To make a timely impact on turbopump systems development, wall-clock time from CAD to solution has to be short enough for design evaluation

⇒ CFD Need
  - Rapid grid generation
  - Accelerated solution time (parallel implementation)
  - Large data set management in multiple sites (transmission and storage)
  - Feature extraction tool

Shuttle Upgrade SSME-rig1

Impeller Grid:
- 60 Zones / 19.2 Million Grid Points
- Smallest zone: 75K / Largest zone: 996K
- Less than 1% orphan points.

Parallel Implementation of INS3D

**RLV 2nd Gen Turbo pump**

114 Zones / 34.3 M grid points

Per processor Mflop is between 60-70. Code optimization for cache based platforms is currently underway. Target Mflops is to reach 120 per processor. Increasing number of OpenMP threads is also the main objective for this effort.
Time Step 13: Impeller rotated 8-degrees at 100% of design speed

After 2 1/2 rotation:

- Status
  - 34.3 Million Points
  - 400 physical time steps in one rotation.
  - One physical time-step requires less than 12 minutes wall-time with 128 CPUs on Origin platforms. One complete rotation requires 3.5 days wall-clock time with 128 processors dedicated to the task.
  - I/O and memory management are critical for wall-clock time reduction.

- Issues / Needs
  - In reality, more than 10% of the supercomputing facility to one task is not always practical.
  - Need 10x bigger supernode or use lower-fidelity method.
  - Communication to/from designers and experimental group is a part of critical technologies (in Grid computing).

- Motor Stator

Issues in Axial flow VAD

- Problems Related to Fluid Dynamics
  - Small size requires high rotational speed
    - Highly efficient pump design required
  - High shear regions in the pump may cause excessive blood cell damage
    - Minimize high shear regions
  - Local regions of recirculation may cause blood clotting
    - Good wall washing necessary

⇒ Small size and delicate operating conditions make it difficult to quantitatively characterize the flow characteristics experimentally.
DeBakey VAD Development Timeline

- Baseline Design

1984 - NASA Johnson Space Center's David Saucier begins initial design work on axial pump VAD with Dr. DeBakey

1988 - NASA/JSC and Baylor College of Medicine signs Memorandum of Understanding to develop the DeBakey VAD

1992 - NASA/JSC begins funding the project

Computational Grid

Rotational Speed : 12,600 RPM
Flow Rate : 5 l/s/min
DeBakey VAD Development Timeline

- CFD Assisted Design
  1993 - NASA/ARC is asked to develop CFD procedure to improve design and performance. D. Kwak and C. Kris visit JSC to study the device. The technology developed for rocket engine such as the Space Shuttle main engine was to be extended to blood flow simulation.

  1994 - Kris and Kwak begin work on design analysis using NAS supercomputers.

  NEW DESIGN WAS PROPOSED TO INCLUDE AN INDUCER BETWEEN THE FLOW STRAIGHTNER AND THE IMPELLER.

  Particle Traces Colored by Velocity Magnitude
DeBakey VAD Development Timeline

- CFD Assisted Design
  1994 - Kiris and Kwak continued design changes
  - IMPROVE BEARING, HUB AND HUB EXTENSION DESIGN TO REDUCE BLOOD CLOTTING

\[\text{Bearing Optimization}\]

- Animal Tests
  1995 - Animal implantation: passed two-week requirements
  1996 - Full design rights are granted to MicroMed, Inc. to produce the pump
  - Began using bio-compatible titanium replacing polycarbonate
  1997 - Configuration design finalized

DeBakey VAD - In situ

DeBakey VAD Development Timeline

- Human Implantation in Europe

1998 - On November 13, 1998, the first six DeBakey VADs are implanted in European patients by Roland Hetzer and DeBakey at the German Heart Institute of Berlin. One of the patients, fifty-six year old Josef Pristov, is able to return home and spend Christmas with his wife after a month's stay for recovery and monitoring at the clinic.
DeBakey VAD Development Timeline

- Human Implantation in USA

1999 - US Patent is granted for the device on September 9, 1999

January 2001 - 124 patients have received the device.
   The longest successful trial period to date in human is approximately 1 year
A patient in Berlin, on his discharge day with the device

A patient in a regular ward before discharge

NASA/DeBakey VAD - Patient Pictures

Accomplishments to date (4/1/02)

- 160+ patients implanted
- Number of patients currently ongoing with device
- US trial
  Approved for trials involving 178 patients (14 male, 6 female have been performed) in a multi-center trial
- European trial
  Received "CE mark" (the EU equivalent to FDA approval)
  The VAD was implanted in 115 people with no device failure
- Results to date
  Favorable compared to existing VADs
  Small incidence of thrombus is being investigated
  Further computational support is necessary
Summary and Discussion-1

- Computational approach provides
  - a possibility of quantifying the flow characteristics; especially valuable for analyzing compact design with highly sensitive operating conditions
  - a tool for conceptual design and for design optimization
- CFD + rocket engine technology has been applied
  - to modify the design of NASA/DeBakey VAD which enabled human implantation
- Computing requirement is still large
  - Unsteady analysis of the entire system from natural heart to aorta involves several hundred revolutions of the impeller
  - During one heart beat, impeller has 125 revolutions
  - With 10^4 processors of Origin, one simulation (with several heart beat) from heart to aorta can be completed in months

  Received 2001 NASA Commercial Invention of the Year Award (6/25/2002)

Summary and Discussion-2

- Further study is needed
  - to assess long term impact of mechanical VAD on human body, which requires modeling flexible wall and non-Newtonian effect and better downstream boundary conditions
- There exist some gaps between
  - CFD (assuming IT is a part of CFD applications) and biomedical expertise
