Jet Propulsion Laboratory, Pasadena, California

Supported by the Mars 2003 Exploration Rover and NASA Code S Battery Programs

NASA Battery Workshop
Huntsville, Alabama
Nov. 20, 2002
Outline

- Introduction and Objectives
- Mission Simulation Testing of MSP01 Lander Cells
- Mission Simulation Testing of MSP01 Lander Battery
- Mission Simulation Testing of 2003 MER Cells
- Mission Simulation Testing of 2003 MER Batteries
- Mission Simulation Testing of Next Generation Cells
- Conclusions
- Acknowledgements
Test Plan for the MSP01 Lithium-Ion Cells and Battery:
Program Objectives

• Assess viability of using lithium-ion technology for future NASA applications, with emphasis upon Mars landers and rovers which will operate on the planetary surface.

• Support the JPL 2003 Mars Exploration Rover program to assist in the delivery and testing of a 8 AHr Lithium-Ion battery (Lithion/Yardney) which will power the rover.

• Demonstrate applicability of using lithium-ion technology for future Mars applications.
  * Mars 09 Science Laboratory (Smart Lander)
  * Future Mars Surface Operations (General)
Lithium-Ion Cell/Battery Development

Potential NASA Benefits and Comparison to Conventional Technologies

**Benefit to NASA Missions**

- **REDUCED POWER SYSTEM MASS**
  - 25% of Ni-Cd/Ni-H₂ Battery Mass
  - 200-230 kg mass savings for 8-10 kW GEO Payloads

- **REDUCED POWER SYSTEM VOLUME**
  - 25% of Ni-Cd/Ni-H₂ Battery Volume
  - Simpler power system integration

- **LOWER LAUNCH COSTS**
  - Reduced power system weight
  - Reduced solar array size

- **ENHANCE SMALL SPACECRAFT MISSIONS**

**Technology Challenges/Drivers**

Lithium-Ion Cells for the Mars Surveyor 2001 Lander
EDL and Mission Simulation Tests

**Requirement:**
- Meet entry, descent and landing (EDL) power requirements
- Successfully cycle cells on the surface of Mars
  (temperature range of -20°C to 40°C)

**Approach:**
- Store cells for > 10 months to simulate cruise period
- Test cells under EDL profile at 0°C
- Cycle cells under varying temperature profile
  - 12 Hour charge period (-20 to 40°C)
  - 12 Hour discharge period (40 to -20°C)
  - Change temperature range to model seasons

**Possible Evaluation Criteria:**
- Discharge voltage on EDL profile (>3.0V each cell)
- End of discharge voltage on cycling test (>3.0V each cell)
- Cell variance
- Capacity fade upon cycling

Yardney 25 Ah Lithium-Ion Cells for Mars Lander Applications
EDL Discharge Profile Simulation of MSP01 Design Cells

- Cells capable of supporting EDL load profile – Including 50 A (2C) pulses
- Cells also display good uniformity after prolonged storage period
Lithium-Ion Cells for Mars Lander Applications
Mission Simulation Cycling (Temperature Range = -20 to +40°C)

5.0 A Charge current to 4.1 V
Total charge time = 12 hours
1.0 A Discharge current for 12 hours
12.0 Ahr Total Discharge Capacity
Lithium Ion Technology Demonstration for Future Smart Lander Missions
Landersurface Operation Mission Simulation Performance Test
2001 MSP01 Surveyor Lander Design Cells (Yardney)

- Minimal performance degradation observed with cells to-date.
- Stable performance observed (constant C/D ratio)
- Excellent reproducibility of cell performance observed:
  - Only 15 mV spread among 4 cells observed for the end of discharge voltage EODV
- The coldest temperature range (-20° to 0°C) appears to be the least detrimental to cell health (< 25 mV decline in EODV observed over last 500 cycles)
- Cells projected to be capable of providing > 1000 cycles (EODV > 3.0V/cell)

Electrochemical Technologies Group
Electrochemical Technologies Group

Lithium Ion Technology Demonstration for Future Smart Lander Missions

Lander Surface Operation Mission Simulation Performance Test

2001 MSP01 Surveyor Lander Design Cells (Yardney)

Watt-Hour Efficiency

- Impedance growth appears to be minimized at the colder temperature range (-20° to 0°C)
- Cycling in the coldest temperature range (-20° to 0°C) results in minimal change to energy efficiency observed
- Long life (> 1000 cycles (EODV > 3.0V/cell)) under these conditions seems probable, providing minimal high temperature excursions.

Electrochemical Technologies Group
MSP 2001 Lander Battery

- Two 25 Ah, 8-Cell Li Ion Batteries (N+1)
- Individual Cell Monitoring and control via Cell Bypass Unit (CBU) to prevent overcharge
- Individual Charge Control Unit (CCU).
- Constant Voltage Charging at - 32.8 Vdc.
- 16 Selectable V/T curves.
- Amp Hour Integration.

Battery Envelope:
- 9.50" x 9.0" x 60°
- 3.63" x 14.60"
Test Plan for the MSP01 Lithium-Ion Battery:
Testing Methodology

• Test Setup
  • Ensure Electrical Isolation (Cell/battery/chamber)
  • 25 Ahr 8-cell battery (24-34.4 V)

• Charge Control
  • 25 Ahr 8-cell battery (24-34.4 V)
  • Battery voltage controlled charging
  • Constant current and constant potential charging
  • Individual cell monitoring
  • Battery protection limits
    • Individual cell voltage exceeded ( > 4.2 V)
    • Individual cell voltage exceeded ( < 2.5 V)
    • Temperature limits exceeded (> 50°C for any input)
    • Charge/discharge capacity limit (>35 Ahr)
    • Step time ( > 10 hours)
  • Battery cell balancing methodology
    (i.e., resistively discharging cells to 2.5V)
Test Plan for the MSP01 Lithium-Ion Battery :
2009 Lander Mission Simulation Testing Plan

1.0 Receiving and Inspection
   • Measure battery voltage and individual cell voltages and Impedance.
   • Ensure electrical isolation (Case)

2.0 Initial Electrical Performance Characterization
   • Implement cell balancing protocol: Resistively discharge each cell to 3.0 V (1 Ohm)
   • 3 cycles at 20°C
     • C/5 charge rate (5 amps) to 32.8 V (8 x 4.1 = 32.8)
     • Constant potential charge to current taper cut-off (0.50 A)
     • C/5 discharge rate to 24 V (or first cell to reach 3.0V)
     • One cycle battery will be charged to 32.0 V (4.0V / cell)
   • 3 cycles at 0°C (repeat testing as above)
   • 3 cycles at -20°C (C/10 charge rate (0.10 A taper cut-off)

3.0 Cruise Storage Test (10-12 Months)
   • Store battery on bus with a clamp voltage of 30.40 V
     (3.8 V x 8 = 30.40 V) (~ 70 % SOC)
   • Store battery at 10°C
   • Record individual cell voltages
4.0 EDL Pulse Capability Test

- Discharge battery using C/5 discharge rate to 24 V
- Cycle battery 3 times at 20°C (determination of storage impact)
- Charge battery using C/5 discharge rate to 32.8 V
- Soak battery for 24 hours at 0°C
- Initiate EDL pulse profile
  - 14 Amps (2 minutes)
  - 8 Amps (7 minutes)
  - 20 Amps (4 minutes)
  - 50 Amps (30 over baseline 20) (100 mSec)
- Discharge battery using C/5 discharge rate to 24 V

5.0 Electrical Performance Characterization

- Same as section 2.0

6.0 Mission Simulation Cycling (In Progress)

- Discharge battery using C/5 discharge rate to 24 V (optional cell balancing)
- Charge battery using C/5 discharge rate to 32.8 V (4.1V per cell)
- Program chamber to run variable temperature profile (see charts)
- Charge battery using C/5 discharge rate (5 A) to 32.4 V (4.05 V per cell)
- Total charge time 12 hours (extended taper)
- Discharge battery using C/25 rate (1A) for 12 hours

7.0 Electrical Performance Characterization

- Same as section 2.0

8.0 Post Mission Characterization

- More detailed pulse characterization
- More detailed rate characterization as a function of temperature
Yardney MSP01 25 Ah Lithium-Ion Battery for Mars Lander Applications
Initial Characterization/Conditioning at Different Temperatures
32.0 V Charge - Discharge Capacity (AHr) at Various Temperatures

**Discharge Capacity (AHr)**

- Battery capacity at different temperatures determined
- Capacity determined after cell balancing
- Greater cell voltage dispersion observed at lower temperature

**Cell Voltage Dispersion (ΔV)**

- Charge Current = 5 A (C/5 Rate)
- Charge Voltage = 32.00 V (4.0 V per cell)
- Discharge Current = 5 A (C/5 Rate)
- Discharge Cut-off = 24.0 V (3.0 V per cell)
- Cell Voltage Cut-Off = 2.5 V and 4.15 V
Yardney MSP01 25 Ah Lithium-Ion Battery for Mars Lander Applications
Initial Characterization/Conditioning at 20°C
After Cell Balancing – 32.8 V Charge

Charge Current = 5 A (C/5 Rate)
Charge Voltage = 32.80 V (4.0 V per cell)
Discharge Current = 5 A (C/5 Rate)
Discharge Cut-off = 24.0 V (3.0 V per cell)
Cell Voltage Cut-Off = 2.5 V and 4.15 V

Total Battery Weight (Two 8 Cell Batteries) = 17.8 Kg
Weight of One Battery = 8.9 Kg

105.4 WHr/Kg

Temperature = 20°C
Yardney MSP01 25 Ah Lithium-Ion Battery for Mars Lander Applications
Cruise Storage Simulation (Bus Voltage = 30.40 V at 10°C)
Battery and Cell Voltages During Storage (~ 9 months)

- Cells balanced prior to storage test
- Cell dispersion potential issue depending upon charge methodology

Electrochemical Technologies Group

Cell and Chamber Temperatures (°C)

Charge current (A)

Cumulative Charge Capacity During Storage (AHz)

Cell Dispersion During Storage (ΔV)
Yardney MSP01 25 Ah Lithium-Ion Battery for Mars Lander Applications

Performance Characterization After Cruise (32.00 V at 20°C)

Cycling Characteristics After Storage (Temperature 20°C) – No Cell Balancing After Cruise

Due to cell imbalance, battery was not fully charged after storage (24.73 Ahr)

Cell #1 terminated charge prior to reaching 32.40 V battery charge voltage

Charge Current = 5 A (C/5 Rate)
Charge Voltage = 32.40 V (4.05V per cell)
Discharge Current = 5 A (C/5 Rate)
Discharge Cut-off = 24.0 V (3.0 V per cell)
Cell Voltage Cut-Off = 2.5 V and 4.15 V

24.73 Ahr Charge Capacity

Electrochemical Technologies Group
Yardney MSP01 25 Ah Lithium-Ion Battery for Mars Lander Applications
Performance Characterization After Cruise (32.00 V at 20°C)

After cell balancing, cell dispersion characteristics were improved.
Yardney MSP01 25 Ah Lithium-Ion Battery for Mars Lander Applications
Performance Characterization After Cruise (32.00 V at 20°C)

After Cell Balancing

After cell balancing, battery was able to be cycled effectively between prescribed voltage limits (24V – 32V)
- 28.90 Ahr delivered at 20°C  (32.0 V Charge or 4.00V/cell)
Yardney MSP01 25 Ah Lithium-Ion Battery for Mars Lander Applications
Performance Characterization After Cruise (32.00 V at 20°C)

After Cell Balancing

- Tighter cell dispersion after balancing cells (cell #1 and cell #6 still somewhat divergent)
- 28.99 Ahr charged at 20°C (32.0 V Charge or 4.00V/cell)

Yardney MSP01 8-Cell Lander Battery

Charge Current = 5 A (C/5 Rate)
Charge Voltage = 32.00 V (4.0 V per cell)
Discharge Current = 5 A (C/5 Rate)
Discharge Cut-off = 24.0 V (3.0 V per cell)
Cell Voltage Cut-Off = 2.5 V and 4.15 V

Temperature = 20°C

12.0 Ahr Total Discharge Capacity
2003 MARS Exploration Rover Secondary Battery

Battery Description

- Rechargeable system: Lithium-ion
- Good low temperature performance
- Demonstrated storage capability
- High specific energy > 100 Wh/kg
- Configuration: Prismatic
- Excellent performance data base
- Two parallel strings each with 8 cells
- Vendor: Yardney Tech. Prod., Inc.

Mission Requirements

- Voltage: 32-24 V
- Capacity: 16 Ah (BOL) at RT and 10 Ah at –20°C (BOL)
- Load: C/2 max at RT; Typical C/5
- Temperature: Charge at 0-25°C and discharge > -20°C
- Light weight and compact
- Long cycle life of over 300 cycles
- Long storage life of over 2 years

Rover Battery intended to support launch, cruise anomalies, and Mars surface operations
Yardney Lithium-Ion Cells for Mars Rover Applications

Mission Simulation of Mars Surface Operations

Mission Simulation Temperature Profile

- Environmental temperature range = 0 to –20°C
- Battery will be charged by solar array during the daytime (≈ 0°C charge)
- Data represents first 8 sols of operation on the surface of Mars
MER 10 Ah Rover Lithium-Ion Battery (FM3A)
Initial Characterization/Conditioning at 20°C

- Conditioning cycles performed at various temperatures (20, 0, and –20°C)
  (C/10 charge-C/5 discharge)
- Minimal cell dispersion observed at the battery level (< 25 mV)

Electrochemical Technologies Group
Good low temperature performance observed at the battery level

- Over 75% of the room temperature capacity delivered at –20°C (C/5 rate)
Mission simulation performed without the benefit of battery charge control electronics
Performance superior to that obtained at cell-level (due to fresher cells and thermal effects)
- Cycling on the surface of Mars is projected to correspond to ~ 50 % DOD
- SOC marginally decreasing with cycling (incomplete charge)
- Trend will be off-set by integration of charge electronics
Future Missions: 2009 Smart Lander Secondary Battery

Battery Description *

- Rechargeable system: Lithium-ion
- High specific energy > 100 Wh/kg
- Configuration: TBD
- Capacity: 30-60 AHr
- Vendor: TBD

Mission Requirements *

- Voltage: 32-24 V
- Capacity: 30-60 AHr
- Load: TBD
- Temperature: Charge at –20 to -25°C and discharge >- 40°C
- Light weight and compact
- Long cycle life of over 1000 cycles
- Long storage life of over 2 years

* Mission currently being re-planned and requirements likely to change.

Lander battery should be capable of supporting launch, cruise, and Mars surface operations over range of temperature (-40 to +40°C).

Improved low temperature electrolytes have translated into increased mission capability.
Introduces possibility of powering survival mode of lander or rover to very low temperatures.
SUMMARY and CONCLUSIONS

• **Li-Ion cells/batteries for the MSP 2001 Lander mission:**
  – Demonstrated the technology readiness of Li-Ion technology (Yardney)
  – Good Discharge Rate Capability (Delivers required capacity at low temp)
  – Good Storage Characteristics (Able to meet other requirements after cruise)
  – Mission Simulation Testing (Able to support > 700 sols on surface..More than 2 Years of operation)
  – Battery fully space qualified (Yardney/LMA/JPL) prior to mission cancellation
  – Lander battery was demonstrated to support efficient Mars surface operation (MSP01 profile)

• **Li-Ion cells/batteries for the 2003 MER mission:**
  – Good Cycle Life Performance (Exceeds requirements at all temps)
  – Discharge Rate Capability (Delivers required capacity at low temp)
  – Mission Simulation Testing (Able to support projected surface operation load profile)

• **Li-Ion cells testing for future Mars Lander applications**
  – Excellent low temperature performance demonstrated in prototype cells
  – Operating temperature range of – 60 to +40ºC demonstrated
  – Improved electrolytes result in improved mission capability
  – Very low temperature capability may be beneficial to power survival mode
Acknowledgments

The work described here was funded by the Code S NASA Battery Program and the Mars 2003 Exploration Rover (MER) and was carried out at the Jet Propulsion Laboratory (JPL), California Institute of Technology, under contract with the National Aeronautics and Space Administration (NASA).
