Microsensor Technologies for Plant Growth System Monitoring

Chang-Soo Kim
Depts. of Electrical & Computer Eng. and Biological Sciences
Univ. of Missouri-Rolla

- Critical need of precise control of root zone; wetness, oxygen, nutrients, temperature.
- Ideal sensor configuration; miniaturization, multiple, array, low power, robustness.
- Thin film flexible microsensor strips for dissolved oxygen and wetness detection.
- Flexible microfluidic substrate for rhizosphere monitoring and manipulation.
Experimental setup with a porous tube growth system

• Dissolved oxygen microsensor strip (3-electrode amperometric measurement by enwrapping the porous tube surface)

• Wetness sensor strip (4-electrode conductivity measurement along the porous tube surface)
Dissolved oxygen measurement on the porous tube surface

- With a commercial oxygen probe;
- Reflecting $O_2$ value of inner sol. at (+) pressures.
- Convergence to 20% value (air-sat. value) at (-) pressures.

- With a microsensor array;
- Reflecting $O_2$ value of inner sol. at (+) pressures.
- Scattering around 0% value at (-) pressures (due to surface dryness and absence of sensor permeable membrane).
Wetness measurement on the porous tube surface

- A steep decrease of surface impedance at the transition from (-) to (+) pressure.
Experimental setup with a particulate growth system (Turface® 1-2 mm size particulate)

- Dissolved oxygen and wetness measurements within an unsaturated Turface® media.
- Repeated flooding and suction of nutrient solution using the embedded porous tube.
Dissolved oxygen measurements within the particulate

- With a commercial oxygen probe;
  - Convergence to $O_2$ value of inner sol. with repeated flooding.
  - Convergence to 20% value (air-sat. value) with suction.

- With a microsensor array;
  - Better reflection of $O_2$ value of inner sol. with repeated flooding.
  - Better reflection of $O_2$ value of inner sol. with repeated suction.
Wetness measurement within the particulate

- Variations of the impedance due to repeated solution flooding and suction.
Flexible microfluidic substrate for rhizosphere monitoring and manipulation

• Root hair growth on the surface of a porous membrane with underlying microfluidic channels and microsensor arrays.

• Exemplary layout of planar microfluidic substrates.
Conceptual growth system using flexible microfluidic rhizosphere substrate

- Rhizosphere manipulation using embedded microchannels (e.g. change of nutrient solution composition).
- Rhizosphere *in situ* monitoring using embedded microsensor arrays or remote optical sensors.
- Root growth pattern analysis using optical imaging.

Intelligent Microsystem Laboratory (http://web.umr.edu/~ckim)  University of Missouri–Rolla
Summary

• Demonstration of feasibility of microsensor for porous tube and particulate growth systems.
  – Dissolved oxygen.
  – Wetness.

• Flexible microfluidic substrate with microfluidic channels and microsensor arrays.
  – Dynamic root zone control/monitoring in microgravity.
  – Rapid prototyping of phytoremediation.
  – A new tool for root physiology and pathology studies.
