at the
2003 NASA Seal / Secondary Air System Workshop
Ohio Aerospace Institute (OAI)
November 5-6, 2003
Artificial Gravity “Bimodal” NTR Crew Transfer Vehicle (CTV) for Mars DRM 4.0 (1999)
The “Bimodal” NTR (BNTR) Integrated Space Propulsion & Power System
-- Smarter Systems Engineering --

- During short, high thrust propulsion phase, each BNTR produces ~340 MWt and ~15 klbf of thrust
- During long, power generation phase, each BNTR operates in “idle mode” producing just ~150 kWt
- A Brayton conversion unit on each BNTR produces up to 25 kW_e to enhance stage capabilities
Rover/NERVA* Program Summary (1959-1972)

- 20 Rocket/reactors designed, built and tested at cost of ~ $1.4 billion

- Engine sizes tested
  - 50-250 klf

- H₂ exit temperatures achieved
  - 2,350-2,550 K (Graphite fuel)

- Iₚ capability
  - 825-850 sec (hot bleed cycle)

- Burn duration
  - 62 mins. (NRX-A6 -- single burn)
  - >4 hrs. (NRX-XE -- 28 burns) (accumulated)

- Engine thrust-to-weight
  - ~3 for 75 klf NERVA

"Open Air" testing at Nevada Test Site

NERVA program experimental engine (XE) demonstrated 28 startup/shutdown cycles during tests in 1969.

*NERVA: Nuclear Engine for Rocket Vehicle Applications
Nuclear Thermal Rocket (NTR) Propulsion

What’s New?

Then (Rover/NERVA: 1959–72)

- Engine sizes tested
  - 50–250 klbf

- H₂ exit temps achieved
  - 2,350–2,550K (Graphite)

- Isp capability
  - 825–850 sec (hot bleed)

- Engine thrust-to-weight
  - ~3 for 75 klbf NERVA

- Testing (Rover/NERVA)
  - “Open Air” exhaust at Nevada test site

Now

- “Current” focus is on smaller NTR sizes
  - 5–15 klbf (Code S science–humans)

- Higher temp. fuels being developed
  - 2,700K (Composite), 2,900K (Cermet) and ~3,100K (Ternary Carbides)

- Isp capability
  - 915–1005 sec (expander cycle)

- Advances in chemical rockets/materials
  - ~2–6 for small NTR designs

- Small NTR allows full power testing in
  - “Contained Test Facility” at INEL with “scrubbed” H₂ exhaust

Environmentally “Green”

Smaller, Higher Performance

Easier to test

For Public Acceptance

NASA/CP—2004-216390/VOL1
Nuclear Thermal Rocket (NTR) Propulsion
-- Key Technology / Mission Features --

- NTR engines have negligible radioactivity at launch / simplifies handling and stage processing activities at KSC
  - < 10 Curies / 3 NTR Mars stage vs ~400,000 Curies in Cassini’s 3 RTGs
- High thrust / Isp NTR uses same technologies as chemical rockets
- Short burn durations (~25-50 mins) and rapid LEO departure
- Less propellant mass than all chemical implies fewer ETO launches
- NTR engines can be configured for both propulsive thrust and electric power generation -- “bimodal” operation
- Fewest mission elements and much simpler space operations
- Engine size aimed at maximizing mission versatility
  -- robotic science, Moon, Mars and NEA missions
- NTR technology is evolvable to reusability and “in-situ” resource utilization (e.g., LANTR -- NTR with LOX “afterburner” nozzle)
“Bimodal” NTR Cargo & Crew Transfer Vehicles
for 1999 Mars Design Reference Mission (DRM) 4.0

6 - “80 t” SDHLVs plus Shuttle for Crew & TransHab Delivery

2011 Cargo Mission 1
Habitat Lander
IMLEO= 131.0 t

2011 Cargo Mission 2
Cargo Lander
IMLEO= 133.7 t

2014 Piloted Mission
Artificial Gravity
Crew Transfer Vehicle
IMLEO= 166.4 t
Modular “Bimodal” NTR Transfer Vehicle Design for Mars Cargo and Piloted Missions

**Bimodal NTR:** High thrust, high $I_{sp}$ propulsion system utilizing fissioning $^{235}U$ produces thermal energy for propellant heating and electric power generation enhancing vehicle capability

**Engine Characteristics**
- Three 15 klb, engines, $T/W_{eng} \approx 3.1$
- Each bimodal NTR produces $25 \text{ kW}_e$
- Utilizes proven Brayton technology
- Variable thrust & $I_{sp}$ optional with “LOX-afterburner” nozzle (LANTR)

**Vehicle Characteristics**
- Versatile design
- “Bimodal” stage produces $50 \text{ kW}_e$
- Power supports active refrigeration of $\text{LH}_2$
- Innovative “saddle” truss design allows easy jettisoning of “in-line” $\text{LH}_2$ tank & contingency consumables
- Vehicle rotation ($\omega$ 4-6 rpm) can provide Mars gravity to crew outbound and near Earth gravity inbound (available option)
- Propulsive Mars capture and departure on piloted mission
- Fewest mission elements, simple space ops & reduced crew risk
- Bimodal NTR vehicles easily adapted to Moon & NEA missions
Mars DRM 4.0: “Bimodal” NTR Crew Transfer Vehicle (CTV) with Inflatable “TransHab” Module & Artificial Gravity Capability

“Bimodal” NTR Core Stage w/Refrigeration
(Sized for Delivery by “Shuttle-Derived” HLV)

3 x 15 klbf BNTRs
\( \text{F/W}_{\text{eng}} \sim 3.1 \)

50 kWe CBC w/Radiator

Refrigeration System

48.6t Capacity \( \text{LH}_2 \) Tank

“In-Line” Propellant Tank
(Tank Jettisoned)

43t Capacity \( \text{LH}_2 \) Tank

Strongback Truss

Jettisonable Consumables (~6.9t)

Shuttle Launched “TransHab” Module
(Payload ~21.1t)

IMLEO: ~166.4 t

ECRV (~5.1t)
"Bimodal" Crew Transfer Vehicle
Earth Orbit Assembly Sequence

1: Rendezvous

Two “80 t” SDHLV payloads rendezvous and dock prior to Shuttle rendezvous.

ECRV retrieved by SRMS.

2: Assembly

ECRV checked out for crew use.

SRMS used to attach packaged TransHab to CTV.

3: Final CTV Configuration

ECRV transfers crew from Shuttle to CTV. Crew inflates TransHab, deploys flooring and partitions, and checks out CTV systems.

*For 15 kib LANT with chamber pressure = 2,000 psia and \( \varepsilon = 500 \) to 1*
“LOX-Augmented” Nuclear Thermal Rocket (LANTR) “Afterburner” Nozzle Concept Demonstration

**LANTR Concept and Benefits:**
- “Afterburner” nozzle increases thrust by injecting & combusting GO₂ downstream of the NTR throat
- Enables NTR with variable thrust and Isp capability by varying the nozzle O/H mixture ratio (MR)
- Operation at modest MRs (<1.0) helps increase bulk propellant density for packaging in smaller volume launch vehicles
- LANTR’s bipropellant operation enables smaller, faster Moon / Mars vehicles when using extraterrestrial sources of H₂ and O₂

**LANTR Test Program Objectives:** (Aerojet & GRC)
- Measure thrust augmentation from oxygen injection and supersonic combustion using small, fuel-rich H/O engine with two different area ratio nozzles (@ 25:1 and 50:1) as “non-nuclear” NTR simulator.
- Use results to calibrate reactive CFD assessment of bimodal LANTR engine

**Status:** LANTR afterburner nozzle demonstrated
- Oxygen injection into hot supersonic flow
- Supersonic combustion in the nozzle
- Elevated nozzle pressures measured
- Benign nozzle wall environment observed
- Increase O₂ consumption rate with nozzle length
- Thrust augmentation >50% measured

Baseline H/O Thrust: 2100 lbf at 1000 psia and MR = 1.5. With GO₂ injection into nozzle, measured thrust due to supersonic combustion is 3200 lbf (~52% thrust augmentation achieved at 50:1 and MR~3.0)
