Abstract

Silicon carbide based advanced ceramics and fiber reinforced composites are under active consideration for use in a wide variety of high temperature applications within the aeronautics, space transportation, energy, and nuclear industries. The engineering designs of ceramic and composite components require fabrication and manufacturing of large and complex shaped parts of various thicknesses. In many instances, it is more economical to build up complex shapes by joining simple geometrical shapes. In addition, these components have to be joined or assembled with metallic sub-components. Thus, joining and attachment have been recognized as enabling technologies for successful utilization of ceramic components in various demanding applications. In this presentation, various challenges and opportunities in design, fabrication, and testing of high temperature joints in ceramic matrix composites will be presented. Silicon carbide based advanced ceramics (CVD and hot pressed), and C/SiC and SiC/SiC composites, in different shapes and sizes, have been joined using an affordable, robust ceramic joining technology (ARCJoinT). Microstructure and high temperature mechanical properties of joints in silicon carbide ceramics and CVI and melt infiltrated SiC matrix composites will be reported. Various joint design philosophies and design issues in joining of ceramics and composites will be discussed.
Joining and Assembly of Silicon Carbide-based Advanced Ceramics and Composites for High Temperature Applications

Outline

• Background and Rationale
• Challenges in Joining of Ceramics and CMCs
  • Joint Design, Testing, and Data Analysis
  • Long Term Durability
• ARCJoinT Technology
  • Silicon Carbide Ceramics
    • Reaction Bonded, Sintered, and CVD SiC
  • Ceramic Matrix Composites
    • CVI C/SiC Composites
    • MI SiC/SiC Composites
• Results and Discussion
  • Monolithic SiC Ceramics
  • CVI C/SiC Composites
    (effect of surface roughness, temperature)
  • MI SiC/SiC Composites
    (flexure testing, tensile testing of lap joints, data analysis)
• Summary and Conclusions
Key Technical Challenges to Insertion of Advanced Ceramic Materials

- Robust Manufacturing
- Processing Consistency/Reliability
- Joining and Attachments
- Scale-up & Demos
- Machining and Repair

- Material Durability
- Degradation Mechanism
- EBCs and TBCs
- NDE and Reliability
- Life Prediction Models
- Sub-Component Tests

- Design Codes
- Databases
- Legal Issues
- Recycling
- Cost Reduction
- Industrial Partnerships
- Training & Education

Interactive and Iterative Approach Across Disciplines Required

Joining and Assembly Technologies Through the Ages

- Prehistoric Civilization
  Attachment Technology for Hunting Tools

- Bronze Age (7000-1000 BC)
  Brazing and Soldering Used for Jewelry and Domestic Articles

- Shang Dynasty
  Ceremonial Vessel - 1100 BC

- Eiffel Tower, Paris 1889
- Microelectronics Packaging
- Aerospace and Defense
- International Space Station
Need for Joining and Assembly Technologies

- Joining is an enabling technology for utilization of advanced ceramics and composites in high temperature applications.
  - Aerospace Systems
    - Aerospace and Space Propulsion Components
      (Combustor Liners, Exhaust Nozzles, Nozzle Ramps, Turbopump Blisks)
  - Non-Aerospace Systems
    - Nuclear Industries, Land Based Power Generation,
      Process Industries, Heat Exchangers, Recuperators,
      Microelectronic Industries (Diffusion Furniture, Boats)
- The development of ceramic joining and assembly capability will allow the application of advanced ceramics and composites technology in a timely manner.

Technical and Performance Requirements for Joined Structures and Joining Technology

- Joint properties comparable to base materials.
  - Use temperature > 1200 °C
  - Good mechanical strength
  - Oxidation and corrosion resistance
  - Low CTE mismatch to minimize residual stresses
  - Good thermal shock resistance
- Leak tight joints.
- Practical, reliable, and affordable technique adaptable to in-field installation, service, and repair.
Joining of Ceramic Components Using Affordable, Robust Ceramic Joining Technology (ARCJoinT)

Advantages:
- Joint interlayer properties are compatible with parent materials.
- Processing temperature around 1200-1450°C.
- No external pressure or high-temperature tooling is required.
- Localized heating sources can be utilized.
- Adaptable to in-field installation; service, and repair.

ARCJoinT is Currently Being Used to Join and Repair a Wide Variety of Ceramic and Composite Materials

- **SIC-Based Ceramics**
  - Reaction Bonded SIC
  - Sintered SIC
  - CVD SIC, Porous SIC

- **SIC/SIC Composites**
  - Melt Infiltrated SIC/SIC
  - CVI SIC/SIC Composites
  - PIP SIC/SIC Composites

- **C/SIC Composites**
  - Melt Infiltrated C/SIC
  - CVI C/SIC Composites
  - PIP C/SIC Composites

- **C/C Composites**
  - CVI C/C Composites
  - Resin Derived C/C
  - C-C with MI

- Composites with Different Fiber Architectures and Shapes
- Ceramics with Different Shapes and Sizes
Experimental Procedures

Materials:
- RB-SiC (REFEL), Sintered SiC (Hexoloy-SA)

Microstructural Analysis:
- TEM, SEM, Optical Microscopy

Mechanical Testing:
- Compression at a constant strain rate ($2 \times 10^{-5} \text{ s}^{-1}$)
- Temperatures ranging from 1235°C to 1425°C, in air
- Joint is formed 45° with the compression axis (scarf butt geometry)

Advantages: Tests require small amount of materials
Stress and strain can be directly measured

Joint thickness:
- Refel RB-SiC: $58.2 \pm 1.2 \mu$m
- Hexoloy-SA SiC: $63.1 \pm 0.6 \mu$m

Mechanical Properties

![Mechanical Properties Graph](image)

The plasticity of the joint is controlled by the deformation of SiC grains.

The low creep resistance of silicon at these temperatures is incompatible with a viscous flow model of deformation.

Challenges in Joining of Ceramic Matrix Composites

- **Joint Design**
  - High elastic modulus of ceramic joint materials provide significant challenges to joint design and characterization.
  - Understanding of stress state in the joints.

- **Materials**
  - Optimization of in-plane tensile properties of CMCs by engineering the fiber/matrix interface are accomplished at the expense of interlaminar properties. Weak interfaces complicate joint properties and performance.
    - Composition and microstructure
    - Bonding and adhesion
    - Testing and data analysis
  - High elastic modulus ceramic joint materials.

- **Applications**
  - Time dependent thermomechanical properties of joints.
  - Environmental effects on joint properties.

Stress Distribution in Single Lap Joints
Subjected to Tensile Loading

(Goland and Reissner)

The expressions for the adhesive and transverse stresses, normalized by the applied tensile stress, are:

\[
\frac{\tau_o}{\sigma_{appl}} = -\frac{1}{8c} \frac{t}{c} \left[ \beta \frac{c}{t} \left( 1 + 3k \right) \frac{\cosh \left( \frac{\beta c x}{t} \right)}{\sinh \left( \frac{\beta c}{t} \right)} + 3(1-k) \right]
\]

\[
\frac{\sigma_o}{\sigma_{appl}} = \frac{t^2}{c^2} \frac{1}{\Delta} \left[ \left( R_2 \frac{\lambda^2}{2} + \lambda k \' \cosh \lambda \cos \lambda \right) \cosh \left( \frac{\lambda x}{c} \right) \cos \left( \frac{\lambda x}{c} \right) + \left( R_1 \frac{\lambda^2}{2} + \lambda k \' \sinh \lambda \sin \lambda \right) \sinh \left( \frac{\lambda x}{c} \right) \sin \left( \frac{\lambda x}{c} \right) \right]
\]
Where

\[ \beta^2 = \frac{8 \ G_c \ t}{E \ \eta} = \frac{4 \ E_c \ t}{E \ \eta \ (1 + \nu_c)} \]  \hspace{1cm} (3)

\[ M_o \approx k \ \frac{T}{2} \ t = \frac{k \ p \ t^2}{2} \]  \hspace{1cm} (4)

\[ k = \frac{1}{1 + 2 \sqrt{2} \ \tanh \left( \frac{\xi \ c}{2 \ \sqrt{2}} \right)} \]  \hspace{1cm} (5)

\[ \xi = \sqrt{12 \ \frac{\left(1 - \nu^2\right) \ T}{E \ t^3}} \]  \hspace{1cm} (6)

\[ \gamma^4 = 6 \ \frac{E_c}{E} \ \frac{t}{\eta} \]  \hspace{1cm} (7)

\[ \lambda = \gamma \ \frac{c}{t} \]  \hspace{1cm} (8)

\[ R_1 = \cosh \ \lambda \ \sin \ \lambda + \sinh \ \lambda \ \cos \ \lambda \]  \hspace{1cm} (9)

\[ R_2 = \sinh \ \lambda \ \cos \ \lambda - \cosh \ \lambda \ \sin \ \lambda \]  \hspace{1cm} (10)

\[ \Delta = \frac{1}{2} \left( \sinh \ 2 \ \lambda + \sin \ 2 \ \lambda \right) \]  \hspace{1cm} (11)
Stress Distribution in Single Lap Joints Subjected to Tensile Loading
(Goland and Reissner)

The geometric and materials parameters c, t, E, v, E₀, and v₀ are given below. Based on this analysis, the experimental tensile data, the geometry of the specimen, and the following elastic properties:

\[
\begin{align*}
E_{\text{substrate}} &= 300 \text{ GPa} \quad (E) \\
v_{\text{substrate}} &= 0.15 \quad (v) \\
E_{\text{adhesive}} &= 350 \text{ GPa} \quad (E_c) \\
v_{\text{adhesive}} &= 0.2 \quad (v_c)
\end{align*}
\]

The maximum transverse and adherent shear stresses were found to be:

\[
\begin{align*}
\frac{\tau_0}{\sigma_{\text{appl}}} &= 4.2 \\
\frac{\sigma_0}{\sigma_{\text{appl}}} &= 5.5
\end{align*}
\]

Maximum Transverse and Joint Shear Stresses in MI SiC/SiC Composites Obtained from Goland and Reissner Analysis

For Tensile Stresses of 45 and 42 MPa:

- Shear Stress:
  \[\tau_0 = 4.2 \cdot \sigma_{\text{appl}}\]
  189 MPa and 176.4 MPa

- Transverse Stress:
  \[\sigma_0 = 5.5 \cdot \sigma_{\text{appl}}\]
  247.5 MPa and 231 MPa

Specimen thickness \( (t) \) : ---

Schematic of Test Fixture Used for Compression Double-Notched Shear Tests
Typical Behavior of Joints During Shear Tests

Compression Double Notch Shear Strength of Joined CVI SiC Composites at Different Temperatures

- Shear strength of joints increases with temperature and is higher than the CVI SiC composite substrate.
- No apparent influence of surface condition on the shear strength of joints.
Summary and Conclusions

- The ARCJoint process has been used to make several types of joints in SiC, C/SiC, and SiC/SiC composites.
- The strength of REFEL RB-SiC material containing a joint is not limited by the joint strength but by the strength of the bulk (parent) material. The strength of Hexoloy SiC joint is limited by the joint strength.
- In C/SiC composites, whether the joined surfaces are as-received (rough) or machined (smooth) has no effect on the shear strength of the joint. Furthermore, the shear strength of all joints exceeds that of the as-received C/SiC at elevated temperatures up to 1350 C.
- High elastic modulus of ceramic joints and weak interfaces in composite materials provide significant challenges to joint design and are critical to joint properties and performance.
- A combination of tensile, shear, and flexural testing of joints coupled with fracture mechanics based design and analysis is needed to generate useful engineering design data.
- Time dependent high temperature thermomechanical properties are critical for the successful utilization of ceramic joining technology for advanced ceramics and fiber reinforced composite materials.
