Human Health & Support Systems
Capability Roadmap
Progress Review

Dennis Grounds
Al Boehm
March 17, 2005
Draft Agenda

8:00 a.m. Welcome & Review Process Panel Chair & NRC Staff
8:15-8:30 a.m. Introduction by APIO to CRM Jan Aikins
8:30-9:00 a.m. Human Health & Support Systems CRM Overview Dennis Grounds
9:00 a.m.-10:30 p.m. Human Health & Performance Dennis Grounds
10:30 a.m. Break
10:45 a.m.-12:15 p.m. Life Support & Habitation Dan Barta
12:15-1:00 p.m. Lunch
1:00-2:30 p.m. Extra-Vehicular Activity Kerri Knotts
2:30-3:30 p.m. Open Discussion/Q&A with NRC Panel All
3:30 p.m. Break/NRC panel meets in closed session
4:15-5:00 p.m. NRC panel discussion with NASA All
5:00 p.m. Adjourn
Capability Roadmap Team

Co-Chairs
- NASA: Dennis Grounds, JSC
- External: Al Boehm. Retired Hamilton Sundstrand

Team Members

Government
- J. Charles, JSC
- R. Carrasquillo, MSFC
- G. Jahns, ARC
- G. Lutz, JSC

Industry
- B. Harris
- R. Poisson, Ham. Sunstrand

Academia
- J. Becker, NSBRI
- D. Akins, Univ. Maryland
- R. Schlegel, Univ. Oklahoma

NASA Technical Leads
- D. Barta, JSC
- K. Knotts, JSC

Other/Independent Coordinators
- G. Miller, Lockheed Martin
- APIO: J. Aikins, JPL

Directorate: E. Trinh, HQ ESMD; D. Craig, HQ ESMD
The Human Health & Support Systems Capability Roadmap focuses on research and technology development and demonstration required to ensure the health, habitation, safety, and effectiveness of crews in and beyond low Earth orbit. It contains three distinct sub-capabilities:

- Human Health and Performance
- Life Support and Habitats
- Extra-Vehicular Activity
Benefits of the Human Health & Support Systems CRM

- The Human Health and Performance area guides the research and countermeasure development to reduce the risks to humans in space flight, as well as define the technology necessary for maintenance of the daily functional requirements of the human system.
  - Space Radiation
  - Medical Care
  - Human Health Countermeasures
  - Behavioral Health & Performance
  - Space Human Factors

- Life Support and Habitation focuses on the research and technology development to sustain the life of the human system during transit and planetary phases of exploration.
  - Life Support Systems (air, thermal, water, food)
  - Environmental Monitoring and Control
  - Contingency Response Technologies
  - Exploration Habitats

- The Extra-Vehicular Activity project develops the technology required to sustain the life of humans outside of the life support systems of the vehicle and surface habitats, as well as the tools required to perform exploration and contingency EVA.
  - EVA suit
  - Pressurized volumes
  - EVA tools
  - Ground support equipment
Roadmap Process and Approach

- Input from internal NASA and contractor experts
- Iterative review with Roadmap team members
- Review with NASA Headquarters Exploration Systems Mission Directorate
- Interim NRC review
- Updates based on the NRC review
- Updates based on Strategic Roadmaps
- Final review with NRC
- Final product updated as required during NASA planning phases
Requirements/Assumptions

- The following Design Reference Missions were used as guidance in some instances:
  - *Human Exploration of Mars: Artificial-Gravity Nuclear Electric Propulsion Option*
  - *Reference Mission Version 3.0 Addendum to the Human Exploration of Mars*
  - *Mars 98 Reference mission: Reference Mission of the NASA Mars Exploration Study Team*
  - *Lunar Surface Reference Missions: A Description of Human and Robotic Surface Activities*
  - *The Mars Surface Reference Mission: A Description of Human and Robotic Surface Activities*

- Potential mission timeframes follow the Document: *ESMD-RQ-0019 Preliminary Title: CEV Concept of Operations Effective Date: 1 September 2004*

- Additional requirements/assumptions are detailed within the sub capability charts
A Capability is defined as a set of systems with associated technologies & knowledge that enable NASA to perform a function (e.g. scientific measurements) required to accomplish the NASA mission.

* Sub-capabilities include Technologies, Infrastructure, and Knowledge (process, procedures, training, facilities)
## Technology Readiness Levels/Countermeasure Readiness Levels

Human Health & Performance

Presenter:
Dennis Grounds
Human Health and Performance guides the research and countermeasure development to reduce the risks to humans in space flight, and defines the technology necessary for maintenance of the daily functional requirements of the human system.

- Space Radiation
- Medical Care
- Human Health Countermeasures
- Behavioral Health & Performance
- Space Human Factors
Reduce Risk

- NASA shall implement a safe, sustained and affordable robotic and human program to explore and extend human presence across the solar system and beyond.

Level 0 Exploration Requirements for NASA

- For Human Explorers to undertake lengthy research trips on other worlds, they will have to maintain their health in environments that possess higher radiation and lower gravity than Earth that are far from supplies and medical expertise.

The Vision for Space Exploration

- The successful development of identified enabling technologies will be critical to attainment of exploration objectives within reasonable schedules and affordable costs.

- Biomedical risk mitigation – space medicine; remote monitoring, diagnosis and treatment.

Excerpt from “Report of the President’s Commission on Implementation of United States Space Exploration Policy,” June 2004

Increase Capability
Current State-of-the-Art for Human Health & Performance

- Shuttle and International Space Station (ISS) standards and practices
- Terrestrial medical capabilities
- Department of Defense (DoD) standards and practices
• Document: ESMD-RQ-0019 Preliminary Title: CEV Concept of Operations
• Effective Date: 1 September 2004

• The Exploration Systems Mission Directorate recognizes the following major programmatic milestones and associated dates:
  – 2008: Initial flight test of a Crew Exploration Vehicle (CEV)
  – 2008: Launch first lunar robotic orbiter
  – 2009-2010: Robotic mission to lunar surface
  – 2011: First uncrewed CEV flight
  – 2014: First crewed CEV flight
  – 2014-2015: Prometheus 1 demonstration mission
  – 2015-2020: First human mission to the Moon

• Spirals 4 and 5 encompass the capabilities necessary to execute piloted missions to the vicinity of Mars as well as landed missions. The date for humans to reach the Mars vicinity is dependent on the development timeline and discoveries that result from the earlier spirals. However, 2030 is being used as a reference date for extensibility criteria and technology planning.

• For planning purposes in this roadmap, target dates were chosen from within the above time spans. These dates will be adjusted as further guidance is given by the Strategic Roadmaps and/or the Directorates.
Definition

- Space Radiation addresses the risks to human exploration from exposure to space radiation, including ionizing radiation, solar particle events (SPE) and galactic cosmic rays.
  - Possible health risks include cancer, damage to the central nervous system, degenerative tissue disease (cataracts, heart disease, etc.), and acute radiation sickness.
- Components include:
  - Risk assessment/projection
  - Shielding solutions
  - Measurement technologies
  - Biological countermeasures
Benefits

- Assure that we can safely live and work in the space radiation environment, anywhere, any time.
- Assure astronauts return to Earth safely, and continue to maintain an acceptable quality of life.
State of the Art

- **Shuttle and ISS shielding**
  - Not inherently part of the vehicle design; some components added late in development
- **Shuttle and ISS monitoring**
  - Equipment no longer reliable
  - Lack system integration
  - Require extensive ground analysis
  - SPE early warning uses NOAA space weather satellites with Earth-based analysis and communication
  - No neutron spectrometer
- **Low Earth Orbit (LEO) exposure limits**
  - Based on LEO environment (different mix of protons and HZE particles)
- **LEO risk assessment**
  - Based on LEO environment (different mix of protons and HZE particles)
- **Space environmental models need to be validated and monitored with in-situ dosimetry**
### Space Radiation Roadmap

**Shuttle & ISS**
- **2005**: Retire Shuttle
- **2017**: ISS End of US commitment

**Spiral 1: Crew Exploration Vehicle**
- **2006**: Crew Exploration Vehicle
- **2007**: Un-crewed Flight
- **2008**: Crewed Flight

**Spiral 2: Extended Duration Moon**
- **2009**: Extended Duration Moon
- **2010**: Mars Vicinity
- **2011**: Long Duration Moon
- **2012**: Mars Surface

**Spiral 3: Long Duration Moon**
- **2013**: Long Duration Moon
- **2014**: Mars Surface

**Spiral 4: Mars Vicinity**
- **2015**: Mars Vicinity

**Spiral 5: Mars Surface**
- **2016**: Mars Surface

---

### Sub-Capability Space Radiation

#### Sub-Capability: Space Radiation

- Safe days recommendation
- Spiral 4-5 Multifunctional shielding materials specs
- Spiral 4 Crew Exposure Limits/ radiation monitoring reqmts
- Spiral 4 SPE warning reqmts
- Spiral 3 Design Optimization Analysis
- Spiral 4 Design Optimization Analysis
- Spiral 3 Crew Selection & Constraints
- Spiral 3 Crew Flight rules & operations
- Spiral 4 Radiation countermeasures
- Spiral 4 Crew Selection & Constraints
- Spiral 4 Flight rules & operations
- Radiation Research to reduce uncertainty in risk projection and develop countermeasures

---

**NOTE:** Milestone colors correspond to spiral color bars above
**Integration Approach**

**Risk**
- Ground research (NSRL) to reduce uncertainty in risk projection/Develop biological CM
- Establish human exposure limits per habitable module
- Establish human exposure limits per exploration mission
- Maintain, improve risk assessment models/Analyze proposed mission architectures
- Develop requirements for habitable volume monitoring/early warning systems
- Develop operations products (flight rules, crew constraints, training, ground segment support)

**Shielding**
- Develop design assessment tools for vehicle architecture
- Evaluate candidate shielding materials (all habitable volumes) for effectiveness
- Establish criteria for secondary space craft usage (material strength, properties, manufacturability)
- Evaluate candidates for secondary space craft usage (structure)
- Material engineering to optimize application (sandwich, impregnation)
- Deliver candidate shielding technologies to space craft developer

---

**Capability Readiness Level**

**Sub-Capabilities**

Proof-of-Concept analyses of the Sub-capabilities are performed. Analytical and laboratory studies of the Sub-capabilities are performed to physically validate separate elements of the Capability. Analytical studies are performed to determine how constituent Sub-capabilities will work together.

*Sub-capabilities include Technologies, Infrastructure, and Knowledge (process, procedures, training, facilities)*
## Maturity Level – Technologies for Measurement Technologies

Note: Unless otherwise indicated, assumes Mars mission scenario
Metrics for Space Radiation

• **Number of safe days in space without exceeding career limits at 95% confidence level**
  - LEO (Spiral 1): three 180-day missions without exceeding career limits at 95% confidence level (Solar Particle Events, Galactic Cosmic Rays, trapped radiation belts)
  - MOON (Spirals 2-3): six 30-90 day missions below threshold for acute effects (Solar Particle Events)
  - MARS (Spirals 4-n): one 1000-day mission without exceeding career limits at 95% confidence level (Galactic Cosmic Rays, Solar Particle Events)
Definition

- Medical Care for exploration missions must provide monitoring, diagnosis and treatment during a mission with little or no real-time support from Earth. It includes identifying, defining and monitoring health risks, establishing medical guidelines, utilizing telemedicine, and developing medical technology for exploration.
  - Medical Devices, e.g., imaging system, surgical instruments, IV fluid generation system, monitoring devices
  - Clinical Capabilities, e.g., crew selection/constraints criteria, pre-mission prevention, on-board procedures, training
  - Medical Informatics, e.g., on-board diagnosis & treatment database
Benefits

• **Reduce Risk by**
  - Enhancing the prevention of medical events through selection, “vaccines,” training, and medical procedures
  - Identifying and preparing for major trauma and medical events pre-flight
  - Inflight monitoring for early detection of health conditions allowing effective, economical, early treatment

• **Increase Capability by**
  - Providing inflight medical care to ensure mission success, productive crew members and protect crew health
  - Using ISS as a testbed to determine space medical norms
  - Improving Medical Diagnostics and Therapeutics
State of the Art

- ISS Crew Health Care System – can provide capability to stabilize and transport crew immediately to Earth
- Terrestrial Medical Technologies – typically not designed to operate in spacecraft closed environment, in microgravity, or in a radiation environment; not designed to minimize mass/volume/power/resources
- DoD telemedicine applications – designed for extreme environments to treat multiple injuries; not constrained to spacecraft resources such as mass, volume, power, interfaces, communication latency; not designed for reduced gravity; has a backup of evacuation to definitive medical care not available for long duration missions
- Shelf life of medical supplies based on terrestrial use – not designed for space radiation environment and the length of a Mars mission
The Human System and Spiral Development for Exploration

** Includes all program requirements

## Medical Devices

- Operations monitoring and intervention
- Blood replacement sys
- Identify sensors, lab tests
- Medical waste management
- Mars major illness & trauma sys
- Identify sensors, lab tests
- Mars medical procedure validation
- Mars crew health optimization
- Space Surgeon training prog (CMO for Mars)
- Train lunar crews
- Mars decision support sys
- Just-in-time training sys for Mars
- Integrated into arch, flight & ground
- Refresher training sys for Mars
- Pharmacology stability studies

## Clinical Capabilities

- Train lunar crews
- Train Mars crews
- Mars medical procedure validation
- Mars crew health optimization
- Space Surgeon training prog (CMO for Mars)
- Clinical watch

## Medical Informatics

- Mars decision support sys
- Just-in-time training sys for Mars
- Refresher training sys for Mars
- Pharmacology stability studies
- Mars medical procedure validation
- Mars crew health optimization
- Space Surgeon training prog (CMO for Mars)
- Clinical watch

### Maturity Level – Capabilities

#### Medical Care

**Integrated Capabilities**

- NASA unique technology(ies)
- Identification
  - Medical Devices
  - Clinical Care
  - Informatics

**Sub-Capabilities**

- Demonstrate in a Laboratory Environment

- Proof-of-Concept analyses of the Sub-capabilities are performed. Analytical and laboratory studies of the Sub-capabilities are performed to physically validate separate elements of the Capability. Analytical studies are performed to determine how constituent Sub-capabilities will work together.

**Capability Readiness Level**

- **Sub-Capabilities**
  - Demonstrated in a Laboratory Environment

- Develop & test prototype systems on ISS, in ground integration facilities, on lunar missions

- Continuously evaluate & infuse new technologies until Baseline medical system per spiral

- Deliver specifications & technology solutions for system development

- Develop ground segment to support flight medical operations

**Integration Approach**

- Deliver specifications & technology solutions for system development

**NASA Pre-Decisional - Interim Draft to the NRC - March 17, 2005**

**Program Goal:**
- Decrease in mission impacts due to medical and crew performance problems.

*There are several metrics that can be used to assess the progress annually:

**Annual:**
- Progression of TRL/CMRL levels of technology components
- Percent coverage of conditions in the Patient Condition Data Base
- Match mass, power, volume, redundancy, modularity, resupply constraints to mission profile
- Few resources spent redesigning (modular design)
- High usability and integrated testing results
- Less crew time needed for ground-based training, on-orbit training, and procedure execution
- High reliability/maintainability (MTBF=Mean Time Between Failures, maintenance time)

NASA Pre-Decisional - Interim Draft to the NRC - March 17, 2005
Human Health Countermeasures

Definition

• Countermeasures mitigate the adverse effects of space flight to ensure that humans can function in a safe and productive manner during transit phases and planetary stays required in exploration missions. Sub-capabilities include:
  – Artificial Gravity, continuous or intermittent
  – Exercise
  – Other Countermeasures to address:
    • Musculoskeletal Alterations (Bone and Muscle)
    • Cardiovascular Alterations
    • Sensory motor and neurological changes (e.g., balance and coordination)
    • Immunology, infection, hematology
    • Environmental Physiology (e.g., Decompression Sickness, toxicity, microbiology)
Human Health Countermeasures

Benefits:

• Reduce Risk by
  – Developing and maintaining permissible exposure limits to the adverse affects of space flight on humans

• Increase Capability by
  – Providing validated Countermeasure Suites for Moon and Mars to manage or prevent:
    • Bone and muscle loss
    • Cardiovascular alterations
    • Sensory motor problems
    • Immunology, infection, and hematology problems
    • Environmental physiology conditions
Currently used countermeasures have been shown to be effective for flight durations up to 180 days.

#### Milestones
- **2018**: SDR▲, PDR▲, CDR▲
- **2019**: SRR▲, SDR▲, PDR▲, CDR▲
- **2020**: 1st Human Mission
- **2021**: SDR▲, PDR▲, CDR▲
- **2022**: SRR▲, SDR▲, PDR▲, CDR▲
- **2023**: 1st Human Mission
- **2024**: SDR▲, PDR▲, CDR▲
- **2025**: SRR▲, SDR▲, PDR▲, CDR▲
- **2026**: 1st Human Mission
- **2027**: SDR▲, PDR▲, CDR▲
- **2028**: SRR▲, SDR▲, PDR▲, CDR▲
- **2029**: 1st Human Mission
- **2030**: SDR▲, PDR▲, CDR▲
**Benefits:**
- Physiological adaptation in-transit (bone, muscle, cardio, neuro, ...)
- Human factors in-transit (spatial orientation, WCS, galley, ...)
- Medical equipment/operations (countermeasures, surgery, CPR, ...)
- Environmental (particulates, liquids, ...)

**Risks/Uncertainties:**
- Engineering (requirements, design: truss, fluid loops, propulsion...)
- Human factors during spin-up/down
- Physiological adaptation during spin-up/down (neuro, cardio, ...)
Evidence Base to Guide Program Decisions

Transit Vehicle
- Continuous AG
  - Trade Space
    - g, r, ω
    - spin up/down req'ts
    - human factors
- Intermittent AG
  - Trade Space
    - g, r, ω, duty cycle
    - exercise req'ts
    - optimal prescription

Surface Ops
- 3/8 g enough?
  - yes
  - no
**Integration Approach**

1. Exploration Requirements and Medical Standards & Bioastronautics Roadmap
2. Individual Investigators: Understand scientific basis of problem; Formulate countermeasure concept
3. Focused research teams: Demonstration of CM efficacy; Laboratory/clinical testing
4. CM evaluation with human subjects in simulated spaceflight environment
5. CM validated with human subjects in Actual Spaceflight environment
6. Countermeasure operational

**Capability Readiness Level**

2. Sub-Capabilities*
   - Demonstrated in a Laboratory Environment

Proof-of-Concept analyses of the Sub-capabilities are performed. Analytical and laboratory studies of the Sub-capabilities are performed to physically validate separate elements of the Capability. Analytical studies are performed to determine how constituent Sub-capabilities will work together.

* Sub-capabilities include Technologies, Infrastructure, and Knowledge (process, procedures, training, facilities)

Definition

- Behavioral Health & Performance addresses the human performance-related challenges associated with space flight due to isolation, confinement and potential hazards. These challenges are characterized by:
  - Team cohesion and productivity
  - Psychological health management
  - Performance readiness
  - Individual and crew selection
Behavioral Health & Performance

Benefits

- Mitigation of risk of human performance failures through in-flight monitoring and early detection of conditions interfering with behavioral performance and health
- Selection of individuals and crews to match mission requirements and team compatibility
- Performance readiness assessments of individuals and crews
- Mitigation and management of risks related to team cohesion and productivity, individual behavioral health, mission safety and mission success
State of the Art

- Anecdotal information from Shuttle, Mir and ISS crews
- Preliminary predictive models for fatigue-related performance deficits based on ground studies
- Dependence on pharmacological aids for sleep management and improvement
- Select-in criteria for astronaut candidate applicants, but no validation with training or performance data
- New select-out criteria and standards developed based on Diagnostic Statistical Manual of Mental Disorders IV; awaiting headquarters approval

**Sub-Capability: Behavioral Health & Performance**

### Team Cohesion & Productivity
- BHP Project Plan
- Computerized conflict mgmt training
- Tech watch for sensors, lab tests
- Identify, test and validate team monitors & metrics for family/ground support in ground analog
- Partnerships for Tech (DoD, NSBRI, other)
- Validate team monitors, family/ground support on ISS
- Develop team risk mitigation system
- Establish train lunar crews

### Psychological Health Management
- Clinical watch
- Enhance data capture from ISS
- Prototype depression mgmt trg
- Identify sensors & lab tests for stress, mood, personality
- Validate individualized predictive models for fatigue (earth, lab)
- Blue light and other circadian rhythm entrainment, safety tests of alerting mechanisms
- Predictive models for lunar cognitive & fatigue related decrements

### Performance Readiness
- Identify sensors, tests for cognitive readiness
- Verify individualized predictive models for fatigue (ISS)
- Just-in-time training methods

### Individual & Crew Selection
- Current astronaut select-in/select-out criteria validated via training and performance data
- Lunar crew select-in/select-out criteria

Metrics for Behavioral Health & Performance

Program Goal

- Reduction in human error due to lack of readiness to perform, behavioral health dysfunction, imprecise selection, or poor team compatibility / productivity

Annual Metrics

- Progression through TRL levels of technology components
- Percent coverage of the gaps across years
- Validation across lab, earth analog, ISS, and lunar testbeds
Definition

- Space Human Factors addresses the human performance-related challenges associated with space flight due to vehicle and habitat design, tool and task design. Space Human Factors mitigates these challenges through the use of:
  - Models and simulations
  - Design tools and requirements
  - Performance measurements
  - Training and decision support systems
Benefits

- Enhanced human performance through incorporation of human factors into vehicle, task and equipment design
- Increased mission success due to well-designed tasks and matching skills and tools to task requirements
- Expanded Non-intrusive performance measures to enable real-time assessment of readiness
- Utilization of appropriate automation to reduce crew workload
- Improved training and decision support systems for greater crew autonomy to enable missions with large communications lags and blackouts
State of the Art

- Anecdotal information from Shuttle, Mir and ISS crews
- Commercial models of 1-g physical performance
- Research models of human cognitive performance
- Commercial CAD design tools do not interface with Human Factors (HF) requirements
- External non-NASA, including DoD, HF knowledge about training, performance measurement, simulations is potentially applicable to some space applications (launch, entry) but not all (microgravity, partial gravity)
Requirements /Assumptions for Space Human Factors

NASA-STD-3000: Human-Systems Integration Standards (HSIS)
- Created by an inter-disciplinary team including NASA, aerospace industry, and academia.
- Agency-wide standard replacing Marshall Space Flight Center and Johnson Space Center Human Factors Standards
- Adopted by the International Standards Organization as ISO 17399:2003
- Includes:
  - Volume: Data for sizing the vehicle
  - Anthropometry & Biomechanics: Data for sizing & operating the vehicle
  - Acceleration Limits: Data for defining the ascent/descent acceleration regimes
  - Radiation: Dose mitigation requirements on a radiation protection system
  - Human/Computer Interaction: Data appropriate to current interface technologies
  - Maintainability/Commonality/Sustainability: Limits to operational overhead
  - EVA: Supporting data appropriate to the top-level EVA requirement for the vehicle
- Document is iterated with supplemental volumes specific to each vehicle or habitat

#### Sub-Capability: Space Human Factors

- **Models & Simulations**
  - Models of human-automation performance
  - Models of human teams
  - Models of partial-g physical performance

- **Design Tools & Requirements**
  - Habitat, transfer vehicle design Rqmts
  - Tools for Team Design

- **Performance Measurements**
  - Tools for partial-g performance measurement
  - Partial-g data collection

- **Training & Decision Support Systems**
  - Training system requirements

**NOTE:** Milestone colors correspond to spiral color bars above.
**Maturity Level – Capabilities**  
**Space Human Factors**

### Integration Approach

- **Human System Integration Standards**
- Research to update contents and fill missing elements
- Evaluate models
- Modify and validate models for NASA applications
- Predict, monitor and assess readiness to perform
- Refine operational tools and capabilities

### Capability Readiness Level

**Sub-Capabilities**

**Demonstrated in a Laboratory Environment**

Proof-of-Concept analyses of the Sub-capabilities are performed. Analytical and laboratory studies of the Sub-capabilities are performed to physically validate separate elements of the Capability. Analytical studies are performed to determine how constituent Sub-capabilities will work together.

*Sub-capabilities include Technologies, Infrastructure, and Knowledge (process, procedures, training, facilities)*

Metrics for Space Human Factors

• **Program Goal**
  – Decrease task time
  – Decrease errors, error rate and the effects of errors
  – Decrease engineering design time
  – Increased usability of equipment and procedures

• **Annual**
  – Progression of TRL levels
  – Fewer resources spent redesigning crew systems
  – High usability and integrated testing results
  – Less crew time needed for ground-based training, on-orbit training, procedure execution
Human Health & Performance
Summary

- Optimal radiation shielding solution for spacecraft.
- Adequate warning systems & effective operational protection for Solar Particle Events.
- Validated selection criteria for crewmembers that reduces personal risk & mission risk.
- Validated countermeasure system that limits the deleterious effects of space flight to ensure crew health and performance, and provides the means by which observed deficits can be remedied.
- Medical diagnostic capability to monitor all aspects of health, including predicted adaptation, and the means by which observed deficits can be remedied.
- Optimized medical system to diagnose and treat the widest range of potential health problems during all mission phases.
- The best possible prediction of risk (including lifetime) to the crew from radiation exposure.
- A system to support normal psychological adaptation to long duration space flight, and the means by which observed deficits can be remedied.
- Accurate predictors of crew task performance during all mission phases.
- Human Factors Engineering that prevents human error and maximizes successful performance.
Life Support and Habitation

Presenter:
Daniel J. Barta
Life Support and Habitation

10 Capability Decision Roadmaps

- Air Revitalization
- Water Reclamation
- Thermal Control
- Solid Waste Management
- Food Provisioning and Management
- Biomass Production
- Internal Monitoring
- External Monitoring
- Control Systems
- Surface Construction
- Habitat Shell
- Internal Systems & Outfitting
- External Systems and Architecture

Human Health & Support Systems

- Human Health & Performance
- Life Support Systems
  - Environmental Monitoring and Control
  - Contingency Response
  - Exploration Habitats
- Life Support and Habitation
- Extra-Vehicular Activity
- Contingency Response
- In Situ Fabrication & Repair
- Fire Prevention, Detection, Suppression

Life Support and Habitation

Roadmaps to be Presented
In addition to the Design Reference Mission and other documents described in introductory slides, many other documents have been considered which have applicability to Life Support and Habitation. This list is for example purposes and is not complete.

**Advanced Life Support Program Documents**

**Spacecraft Requirements Documents**
- Medical Operations and Requirements Documents
- Manned Systems Integration Standards

**National Research Council Reports and Guidelines**
- Spacecraft Maximum Allowable Concentrations for Selected Airborne Contaminants (1994-)
- Spacecraft Water Exposure Guidelines for Selected Contaminants (2000-)
- Safe Passage: Astronaut Care for Exploration Missions (2001)
Atmosphere Revitalization
Description

- Air quality control technologies for enabling long duration exploration missions
  - Meet or exceed mission requirements
    - Constraints for mass, volume, power, thermal management, and maintainability, i.e. crew time and logistics
  - Provide sustainable operational robustness
    - Crew and mission safety
    - Mission success
    - Autonomous operation

- Key functional areas for development
  - Atmospheric gas supply, distribution, and partial pressure control
  - Air quality control during normal mission operations
    - Carbon dioxide, trace chemical contaminant, and particulate matter removal
    - Humidity control
  - Waste gas processing
    - Convert to useable forms
    - Enable higher degree of life support system closure
  - Operational robustness to respond and recover from off-nominal situations
  - Process design and integration
    - Interaction with other life support process functions and resources
Atmosphere Revitalization Benefits

- Control atmospheric quality by maintaining carbon dioxide, humidity, trace chemical components, and particulate matter within specified limits for maintaining crew health and safety
- Robust capability to store and distribute atmospheric gases necessary to control major constituent partial pressure
- Provide operational robustness to respond to and recover from off-nominal cabin atmospheric quality events
- Emphasize maintainability and operational autonomy to achieve minimal crew intervention and logistics resupply
- Minimize equipment mass, volume, power, and thermal loads relative to existing applications
- Advance a functional design approach to achieve life support system oxygen loop closure
- Simplify process design and operations to significantly contribute to advances in system reliability and crew and mission safety
Atmosphere Revitalization
State-of-the-Art

- Atmosphere revitalization technologies in operation on board the International Space Station, Space Shuttle, and Spacelab
  - Carbon Dioxide Partial Pressure Control
    - Shuttle and Spacelab: consumable lithium hydroxide (LiOH) canisters
    - ISS: regenerable 4-bed molecular sieve process that provides for water recovery; regeneration accomplished by combined thermal-vacuum swing
  - Oxygen Generation
    - Shuttle and Spacelab: None
    - ISS: Solid Polymer Electrolyte (SPE) Oxygen Generation Assembly (OGA)
  - Trace Chemical Contaminant and Particulate Matter Control
    - Shuttle: expendable activated charcoal upstream of the LiOH; expendable ambient temperature catalytic oxidation of CO and H₂; 280-micron nominal filters for particulate matter
    - Spacelab: same as Shuttle except added an expendable mixed-media scrubber for trace contaminant and CO control
    - ISS: expendable activated charcoal with a high temperature catalytic oxidation and expendable LiOH for acid gas control; HEPA (0.3-micron nominal) filters for particulate matter
  - Atmospheric Gas Storage
    - Shuttle: High pressure storage; supercritical cryogenic storage for metabolic O₂
    - ISS: High pressure storage; Oxygen recharge capability.
  - Gas Recovery for System Loop Closure
    - Presently not on board Shuttle or ISS; CO₂ reduction risk mitigation in work
Atmosphere Revitalization
Requirements & Assumptions

- **Long Duration Missions Drive Requirements**
  - Missions to ISS and other LEO operations can use existing SOA with some modification
    - Potential for extended duration Lunar and Mars transit flight demonstration on ISS
  - Extended duration Lunar missions and Mars transit/Mars vicinity drive technological needs and departures from existing SOA

- **Additional Assumptions**
  - Loop closure and water recovery from CO$_2$ a priority for extended duration missions
  - Mission duration beyond 6 months will result in more challenging air quality standards for carbon dioxide, trace contaminants, and particulate matter
  - Long duration, continuous exposure to suspended particulate matter and the need to protect the crew and equipment from planetary dust will drive particulate filtration
  - Hypogravity environments (Lunar and Mars surface) may alleviate some microgravity issues but may also require Lunar demonstration testing
  - Mission requirements will drive multi-element technology commonality and architectural/functional interfaces with AEVA, ISRU, AEMC, etc
  - Trade studies based on performance testing data support decision points.
  - Consider reduced pressure vehicle and habitat applications. May drive range of developmental testing conditions.

NASA Pre-Decisional - Interim Draft to the NRC - March 17, 2005
Water Recovery Systems

Description

- Water recovery systems transform crew and system wastewater into potable water for crew and system reuse.
- Biological and/or physical/chemical methods employed to remove contaminants
- Biocides added for residual disinfection to inhibit microbial growth in storage tanks.
- Processing strategy
  - Transport and storage of wastewater from human interfaces
  - Primary processing: organic and nitrogenous contaminant reduction
  - Secondary processing: inorganic contaminant reduction
  - Brine dewatering: water removal from highly concentrated brine
  - Post-processing and disinfection: polishing to meet potability standards
  - Storage and transport of potable water prior to consumption
Water Recovery Systems

Benefits

- Potable water ensures crew health
- Recovery of potable water from wastewater reduces mass of consumables required for mission

Effect of water processing on the ESM of a Lunar Outpost, Mars Transit Vehicle, and Mars Habitat with respect to mission duration

Water Recovery Systems
Current State-of-the-Art

- Vapor compression distillation technology
  - Rotating distillation process
  - Used for urine treatment
  - Organic and inorganic removal
  - Produces brine
  - Distillate requires further treatment to reach potable quality
- Multifiltration beds
  - Organic and inorganic removal
  - Requires consumable adsorption / ion exchange beds
- Volatile removal assembly
  - Catalytic oxidation
  - Operates at high temperature conditions
  - Requires adsorption bed for residual organic acid removal
- Microbial check valve
  - Dispenses iodine for disinfection of potable water
  - Iodine must be removed prior to consumption of water by crew
Water Recovery Systems
Requirements /Assumptions

- Driving issue for Water Recovery Systems is the need to reduce the dependency on resupply for long duration missions
- Spirals 3, 4 and 5 drive the need for Water Recovery Systems
- Additional Assumptions:
  - Personal care cleanser will need to be defined early
  - WRS will drive selection of urine pretreat system, with input from waste collection system
  - Prototype urine pretreatment system will be tested in Spiral 1
  - Wastewater sources for Spiral 4 will be pretreated urine and humidity condensate
  - Wastewater sources for Spirals 3 and initial Spiral 5 will be pretreated urine, hygiene wastewater, laundry, and humidity condensate
  - Later Spiral 5 mission will include food processing waste, inputs from ISRU
  - If ISRU water is available, water quality information will be available from prior robotics missions
Water Recovery Systems Roadmap

| Capability | Life Support & Habitation |

Water Recovery

- Wastewater collection
- Urine pretreatment and stabilization
- Primary WW treatment
- Distillation technologies
- Biological water processor

Urine Pretreatment And Stabilization

- Delivery system microgravity refinements
- Prototype development
- Integrated BWP subsystem testing
- Subsystem development
- Requirements assessment

Regenerative Primary Processors

- Pretreatment systems for mature planetary systems
- Develop prototype for Spiral 2 test?
- Increase WW to include shower and laundry
- Food processing waste characteristics

Spiral 1: Crew Exploration Vehicle
- Un-crewed Flight
- Crewed Flight

Spiral 2: Extended Duration Moon
- 1st Human Mission

Spiral 3: Long Duration Moon

Spiral 4: Mars Vicinity

Spiral 5: Mars Surface

      - Thermal Control
      - Solid Waste Management
      - Food Provisioning and Management
      - Biomass Production
Active Thermal Control Systems (ATCS) are required to control cabin and hardware temperatures within a vehicle.

- **Heat Acquisition and Humidity Control** – acquire waste heat from cabin air and vehicle hardware.
- **Heat Transport** – transport heat within the vehicle or habitat.
- **Heat Rejection** – reject energy from the vehicle or habitat, in the form of heat, to the environment.
Benefits

- Maintain a comfortable temperature and humidity environment for crew
- Maintain hardware temperatures within operating limits

Benefits of advanced developments in Active Thermal Control System hardware

- Decreased mass, power, or volume
- Decreased risk
- Enable heat rejection in new environments (higher temperatures or different ambient pressures)
- Increased life
Active Thermal Control
Current State-of-the-Art

• Heat Acquisition and Humidity Control
  – Metal coldplates
  – Liquid-to-liquid compact heat exchangers
  – Air-to-liquid heat exchangers
  – Slurper bars and rotary separators for condensate collection

• Heat Transfer Technologies
  – Pumped liquid loops
  – Internal water loops and external refrigerant loops (Freon 21, ammonia)
  – Metal bellows accumulators

• Heat Rejection
  – Aluminum radiators (Z93 or Silver teflon coatings)
  – Porous plate sublimators
  – Flash Evaporator System (FES) – water spray boiler
  – Ammonia boiler
Active Thermal Control
Requirements /Assumptions

• Drilling Mission Requirements and Assumptions
  – General Assumptions
    • Vehicle heat load
    • Heat rejection environment
      ▪ Radiation sink temperature
      ▪ Pressure
      ▪ Micrometeoroid and Orbital Debris
      ▪ Dust – unique to Lunar and Mars surface missions
    • Available vehicle surface area for mounting radiators
    • Mission duration
    • Availability of heat transfer fluid that enables a single loop for inside both the cabin and radiators
  – Mission Specific Requirements and Assumptions
    • Requirement for cabin pressure & depressurization (Spirals 1-5)
    • Requirement for collecting humidity condensate (Spirals 3 – 5)
    • Requirement for assembly and maintenance during the mission (Spirals 3 – 5)

Volume Reduction
    Storage space for wastes is very limited on space vehicles. Volume reduction or compaction saves valuable space.

Water Removal and Recovery
    Many wastes such as concentrated water brines or food scraps contain substantial quantities of water that can be recovered.

Safening – Stabilization
    Safening means processing the waste to make it safe for the crew or harmless to planetary surfaces. Once safened, stabilization assures that the waste does not change its state.

Containment and Disposal
    Contained waste is isolated from the crew and the rest of the world. Waste is disposed when the final act of handling or accessing is completed. Disposal can be onboard, overboard, in space, and on planetary surfaces.

Resource Recovery
    Waste can be processed for reuse for the initial function, or it can be converted to new useful materials. Examples include cleaning clothes for reuse, converting waste to minerals for use as food growth nutrients, and pyrolyzing waste to form activated carbon.
The general benefit of waste management capabilities is to reduce mission cost and satisfy mission requirements:

- Crew health and safety
- Crew quality of life
- Planetary protection – forward protection of Mars for instance, and backward protection of Earth

Specific benefits:

- **Compaction** minimizes volume occupied by waste and thereby recovers volume. Used in conjunction with heat, compaction can also recover water and stabilize waste.
- **Mineralization** recovers resources such as water and decreases waste volume. Depending on extent of processing, mineralized products are rendered partially to completely biologically nonhazardous and inert.
- **Water removal and recovery** contributes to closure of the water loop and also results in reduced volume. Microbiological and pathogenic activity is inhibited in dried residue thus protecting crew health.
- **Overboard disposal** eliminates the need to provide stowage volume, eliminates the need to process waste to protect the crew, and reduces propulsion needs.
- **Containment** of waste protects the crew from physical, chemical, and biological waste hazards onboard the spacecraft. It also protects planetary surfaces from contamination with microbes and biomarkers and protects Earth from back-contamination.
- **Resource Recovery** reduces the cost of resupply of items such as clothing and nutrients for plant growth.

Waste management technologies for space life support systems are currently at low development levels. Manual compaction of waste, collection in plastic bags (general waste) and hard containers (feces), and disposal to earth return vehicles are the primary current waste management practices. Without improvement of capabilities, such practices on future missions will expose the crew to biological and chemical waste hazards, obstruct crew quarters with accumulated waste, forfeit recoverable resources such as water, consume valuable crew time, contaminate planetary surfaces, and risk return to Earth of extraterrestrial life.
Waste Management
Requirements / Assumptions

• Requirements
  – Crew health and safety
    The longer duration of future missions without access to routine resupply and disposal resupply missions means that waste needs improved management to assure crew safety. Detailed requirements in this area are not yet established. Safening is required. It is assumed drying is the minimum level of safening. Mineralization can also dry waste and may provide better protection from hazards at the same cost.
  – Crew quality of life
    Odor, clutter, and other qualities of waste can negatively affect crew outlook and performance. Detailed requirements for waste are not yet established. It is assumed that this requirement supports the need for improved management of waste via deodorization, compaction, drying, and mineralization.
  – Planetary protection – forward protection of Mars, and backward protection of Earth
    International agreements prohibit harm to planetary surfaces such as Mars. Mars biota and the search for life must be protected from Earth biology. Clearly Earth must also be protected from possible Mars biology. Until unknowns are resolved for Mars, early missions may need to manage wastes more carefully than later missions (as was the case for the moon). Bringing all wastes back is prohibitively expensive, hence waste must be managed to allow disposal on Mars. Development of detailed planetary protection requirements is currently being pursued.
Missions and assumptions driving the development plan

For near term missions such as Spirals 1 and 2:
- Odor control and mechanical waste compaction must be ready for these spirals because these capabilities are justified by requirement and/or cost.

As missions progress to longer duration and further distances (Spirals 3 to 5)
- Water recovery, and clothes washing are payout projects and must be ready by spiral 3.
- Capabilities needed for Mars are to be tested on the moon, and hence at least advanced prototypes for capabilities such as mineralization and nutrient recovery must be ready for moon testing.
- Containment will need development specific to missions because requirements differ by mission: the moon (bio contamination not an issue), transit (in-space overboard disposal), and Mars (bio contamination of Mars prohibited).

Food Provisioning and Management

Description

- Advanced Food System is required to maintain health of the crew during the entire mission
  - Stored Ready-to-Eat Foods – prepackaged food items will be used during transit and surface missions
    - Food packaging
    - Food preservation
    - Stored food stowage
  - Raw Commodity Processing and Stowage – fresh fruits and vegetables can be used throughout mission. The processed food system will be used on lunar or planetary surface.
    - Raw commodity stowage
    - Raw commodity processing
    - Processed ingredient stowage
  - Menu Development and Galley Procedures – development of nutritionally complete menu with corresponding galley procedures
    - Food preparation
    - Prepared food stowage
    - Meets nutritional needs of crew
Food Provisioning and Management

Benefits

• The development of an advanced food system will enable support of humans beyond Low Earth Orbit (LEO).

• Food must be safe, nutritious and acceptable to maintain crew health and well being throughout the entire mission.
  – Food has a psychosocial element in addition to nutrition
  – Crew performance and well-being dependent on a high quality food system.
  – Use of resources will be minimized.

• Fresh vegetables provide the crew with bright colors, aromas, and improved nutrition

• Food processing will provide the crew with a variety of fresh and nutritious foods throughout the entire mission
Food Provisioning and Management
Current State-of-the-Art

• Stored Ready-to-Eat Foods
  – Food packaging
    • MRE pouch used for thermostabilized and irradiated foods has a high barrier to moisture and oxygen due to the aluminum layer. However, it is dense and hard to process by solid waste processing team
    • Poly material used for freeze dried foods and natural form foods has poor barrier materials and is overwrapped with a foil pouch for ISS
  – Food preservation
    • Freeze dried and natural form foods have a shelf life of 12 months
    • Thermostabilized and irradiated foods have a shelf life of 3 years

• Raw Commodity Processing and Stowage – there is no available processing equipment

• Menu Development and Galley Procedures
  – Have capability to determine nutritional content of menu
  – Have capability to heat and rehydrate stored food system
  – Have capability of a 10-day menu cycle
Food Provisioning and Management Requirements /Assumptions

- **Spirals 1 and 2**
  - Able to use current ISS food system
  - Depending on vehicle design, may need to develop food warmer and rehydration station

- **Spiral 3**
  - Moon will be used as a test bed for Mars missions
  - Fresh vegetables and fruits will be available for consumption (hypogravity)
  - Some food processing and food preparation will be available during the mission
  - Packaging materials with an aluminum layer will be more difficult for solid waste processing
  - Hypogravity and lower atmospheric pressure will affect food processing and food preparation procedures

- **Spiral 4**
  - Stored ready-to-eat foods will require at least a 3-year shelf life
  - Fresh vegetables and fruits will be available for consumption (microgravity)

- **Spiral 5**
  - Stored ready-to-eat foods, raw commodities, and resupply items will require at least a 5-year shelf life
  - Radiation may affect quality and functionality of ready-to-eat foods
  - Fresh vegetables and fruits will be available for consumption (hypogravity)
  - Radiation may affect quality and functionality of stored raw commodities
  - Hypogravity and lower atmospheric pressure will affect food processing and food preparation procedures
  - All available raw commodities will be processed into edible food ingredients
  - Recipes will be prepared utilizing all available processed food ingredients, resupply items, and freshly harvested vegetables and fruits
  - During a long duration mission, food acceptability and variety will contribute to the crew’s psychosocial well-being

**Food Provisioning and Management**

**Figures of Merit**
Biomass Production Description

Production of Fresh Food Supplements for Transit

Operate and maintain a transit crop production system to provide:
1) fresh vegetables to supplement the crew diet, and
2) psychological benefits.

Production of Fresh Food Supplements for Planetary Surface

Operate and maintain a surface crop production system (CPS) to provide fresh crop foods for 10% of crew’s diet. The unit would also provide 20% of the crew’s \( \text{O}_2 \) needs and 20% of the \( \text{CO}_2 \) removal.

Bioregenerative Life Support

Expanded or multiple CPS units to provide 25% of the diet and 50% of atmospheric regeneration.

Assess alternative biomass production technologies such as algae, aquaculture, etc.
Biomass Production Benefits

- Crops produce a continuous supply of fresh foods that can supplement the crew’s diet.
  - Color, flavor, and variety in the diet
  - Bio-available nutrients and antioxidants
- Living plants provide a positive influence on crew well-being and performance.
- Crops contribute to CO$_2$ reduction, O$_2$ production, and water purification, thereby unloading other ECLSS components.
- Bioregenerative systems with crops or other photosynthetic organisms provide the only means for achieving a high level of mission (life support) autonomy.
Biomass Production
Current State-of-the-Art

- **Earth-Based Systems**
  - Terrestrial greenhouses are used for crop production but are not constrained by energy, mass, volume, pressure difference, radiation, and gravity.

- **Space-Based Systems**
  - Short-duration experiments have been carried out on Shuttle and ISS, but we know little about operating sustained crop production systems in space.

  Current small plant chambers* include:
  - SVET (Russian) (lost with Mir)
  - Lada (Russian)
  - PGBA (Plant Generic Bioprocessing Apparatus)
  - Advanced Astroculture
  - PGF (Plant Growth Facility)
  - BPS (Biomass Production System)
  - CPBF (Commercial Plant Biotechnology Facility) (not flown)

  Component technology challenges include:
  - Energy efficient lighting
  - Reliable water / nutrient delivery systems for \( \mu \)- and fractional g.
  - Thorough understanding of crop responses to space environments.
  - Appropriate species and cultivars for space.
  - Mechanized and/or automated approaches to reduce crew time.
  - Demonstrated capability to sustain production over mission durations.

* All of these systems provide less than 0.25 m\(^2\) growing area, and most < 0.1 m\(^2\).
Assumptions that drove the need for the capability
- Continuous need for fresh foods in the crew’s diet.
- Positive effects of living plants on crew well-being and performance.
- Eventual need to rely on bioregenerative technologies for food, air, and water regeneration for true mission autonomy.
- ISS can be used for component testing of transit technologies.

Crop (biomass) production technologies are appropriate for the following missions:
- Spiral 1 (Robotic Lunar Mission Payload), test regolith, remote operations, and materials for plant growth chambers.
- Spiral 2 (Robotic Mars Mission Payload), test regolith, remote operations, materials, and pre-deploy potential for surface crop production system.
- Spiral 3 (Long-Duration Lunar), validation of planetary surface crop production system.
- Spiral 4 (Mars Vicinity - Transit), operational μ–g crop production system.
- Spiral 5 (Mars Surface), operational planetary surface crop production system. Expansion of bioregenerative life support capability.
## Biomass Production Roadmap

### Shuttle & ISS
- Retire Shuttle
- ISS End of US commitment

### Spiral 1: Crew Exploration Vehicle
- SRR
- SDR
- PDR
- CDR
- Un-crewed Flight
- Crewed Flight

### Spiral 2: Extended Duration Moon

Environmental Monitoring & Control Description

- **Monitor the Internal environment**
  - In a closed environment, trace chemicals can build up
    - Like sick building syndrome, but worse—crew cannot go outside for fresh air
  - Indicators of equipment status
    - For example, a malfunction in air processing may be indicated by a tiny methane leak: not toxic, but the malfunction is hazardous

- **Monitor the External environment**
  - Look for leaks and other indications of problems
  - Verify that areas such as airlocks are adequately free of lunar or martian dust
  - Monitor for TBD surface environment hazards

- **System Integration & Control** to reliably and efficiently maintain a safe environment
  - Ground control must play a lesser role since future missions will have long time delays in communications with Earth.
  - Maintaining a large support team 24/7 is expensive, just as it is in manufacturing and other industry
  - Large crew to continuously operate systems is not affordable
Environmental Monitoring & Control Benefits

- Environmental monitoring needed to
  - Detect trace buildup so that countermeasures are implemented before it becomes hazardous
    - Closed loop life support has potential for gradual chemical buildup
  - Detect hazardous events rapidly
    - Events such as spills and leaks can be especially hazardous in the closed environment
    - Many events have proven to be unpredictable, so identification and quantification of unknowns is important
  - Must be done in flight since sample return not feasible

- System Integration & Control benefits:
  - Automation of many processes reduces crew and ground support needs
  - Efficient use of resources: mass, volume, power,…
  - Efficient and safe recovery from environmental perturbations
  - Stable, reliable operation
  - Assistance in predicting, diagnosing, and solving problems
Environmental Monitoring & Control
Current State-of-the-Art

- **SOA in flight (Space Station):**
  - Volatile Organic Analyzer: Gas Chromatograph/Ion Mobility Spectrometer, has been nonfunctional for several months
  - Major Constituent Analyzer: Magnetic Sector Mass Spectrometer, has been serviced
  - Compound Specific Analyzer/Combustion Products: handheld commercial device
  - Russian monitoring devices of unknown technology
  - Simple thresholding process control

- **Ground SOA Monitoring technologies**
  - Laboratory benchtop instruments: Highly capable, but
    - Still relatively high in mass & power requirements
    - Require considerable training, regular calibration, consumables
    - Often require gravity to operate
  - Industrial monitors
    - Usually not sensitive enough for NASA purposes
    - Limited to a few targets, so that many devices are needed to cover the dozens of targets required by NASA

- **Ground SOA Industrial Control**
  - Steady state, vs NASA needs which are dynamic
  - Input/output vs closed loop life support
• All crewed missions require environmental monitoring
  – The shortest missions may need as little as grab sample bottles for later ground analysis
  – The longer the mission, the greater the complexity and number of failure modes, and the greater the monitoring needs
  – Regenerated water quality should be tested before consumption
    • Realtime analysis to avoid need to carry days of stored water while waiting for water test results
  – Regeneration of water and air may have contamination issues which have not yet been seen
    • Chemical buildup, microbial growth

• Process control
  – Offers assistance in diagnosis/prognostics in shorter missions
  – Is crucial for longer missions using closed loop life support
  – Health monitoring with process control helps identify failures earlier, before they become more serious, and can reduce downtime

- Fire Prevention, Detection, & Suppression
- Exploration Habitats
- Contingency Response
- Life Support Systems
- Fire Prevention, Detection, Suppression
**Critical Issue**

Fire in spacecraft is classified as a catastrophic risk. The risk of fires in crew spacecraft and habitats cannot be eliminated. The FPDS element seeks to quantify and minimize the risk (both probability and severity).

**Scope**

- **Materials** must be selected throughout system design and operation stages to minimize the probability of a fire
  - Material flammability acceptance criteria

- Atmosphere selection is a trade-off between material flammability, EVA constraints, and hypoxic limits
  - Ignition, heat release rates, and flammability limits in candidate atmospheres

- **Detection** of a fire event must be accurate, timely and location-specific
  - Network of appropriate sensors and associated fire detection logic
  - Knowledge of fire signatures in low- and partial gravity

- A robust means to **suppress** a fire event must be available and compatible with vehicle design
  - Effectiveness of suppressants and delivery method in low and partial gravity
  - Mitigation of post-fire toxic by-products and collateral damage; minimize impact to crew, system, and mission
Benefits of Fire Prevention, Detection, and Suppression

- Increase the probability of continuing the mission in the event of fire
  - Systematically reduce risk and severity of fire
  - Minimize impact of a fire on the crew, equipment, and mission
- Reduction in vehicle mass through appropriate selection/evaluation of materials
  - Use of COTS hardware typically requires application of fire breaks to pass flammability tests
  - Use reduced mass components where appropriate as determined by quantifiable flammability/risk assessment
- Significantly reduce false positive (nuisance) alarms
  - Susceptibility of ISS smoke detectors to dust requires unnecessary crew action and reduces confidence
- Reduction in suppressant system mass and amount of suppressant dispersed during fire response
  - Reduction of suppressant discharged reduces the impact on the crew and consumables required for clean-up/recovery
- Increased efficiency of fire response through simulation of realistic fire scenarios and crew training
Current State-of-the-Art for FPDS

  - Test 1: Upward Flame Spread Test

- Smoke Detectors
  - STS: ionization
  - ISS RS and FGB: ionization
  - ISS US: photoelectric

- Fire Extinguishers
  - STS: Fixed and portable Halon
    - ISS US: CO₂
    - ISS RS: Water-based foam

- All existing technology and requirements are based on 1-g fire behavior
- Effectiveness in low-g is unproven as evidenced by the inconsistent approaches
Requirements/Assumptions for Fire Prevention, Detection, and Suppression

- FPDS capability is driven by the mission requirements of all spirals
  - Fire Prevention and Material Flammability
    - Selection of atmosphere for habitable volumes
    - Flammability in partial gravity (Spirals 3, 5: Lunar and Martian habitats) is different than zero-gravity (Spirals 1-5: transit vehicles)
  - Fire Detection
    - Driven by experience on ISS
      - Nuisance alarms caused by dust
    - Detectors must be sensitive to appropriate pre-fire and fire signatures
      - Will vary with materials used, atmosphere and gravity level
  - Fire Suppression and Response
    - Selection of a suppressant and definition of response strategy will change with gravity level and habitable atmosphere

- Additional Assumptions
  - Habitable atmosphere will be the same for all spirals and different than ISS/STS
    - If not, material assessment/selection and design criteria for fire detection and suppression systems must be re-evaluated for each spiral

In Situ Fabrication and Repair Capabilities

• Multi-Material Fabrication (MMF) Capability
  – Will utilize shop level equipment to provide a means of fabricating new or replacing existing parts, tools, components, etc.
  – Fabricated products will include various material types such as metals, plastics, ceramics and composites to fulfill requirements for all functioning elements used in the in situ equipment and habitat
  – Products include newly defined parts or tools within an element of the transport vehicle, other vehicle equipment, habitat equipment, and necessary medical products (such as syringes, needles, surgical instruments, inflatable casts, IV bags, etc.)

• Electrical/Electronics Fabrication (EF) Capability
  – Will utilize printed electronics techniques to provide a means of fabricating new or replace existing electronic boards and components

• Multi-Material Repair (MMR) Capability
  – Multi-material patching, bonding, and filling techniques will be developed to provide repair capabilities for most or all materials subject to in-situ failures
  – MMR will utilize in-situ, imported, and recycled materials as provided by a logistics support function
  – Repairs will target the inclusion of all system and element material types utilized during transport and while on extraterrestrial bodies

• Electrical/Electronics Repair (ER) Capability
  – Self-healing materials and metal joining techniques will be developed to provide repair capabilities for electrical/electronics materials subject to in-situ failures
  – ER capabilities will utilize in-situ, imported, and recycled materials as provided by a logistics support function
In Situ Fabrication & Repair Benefits

- In Situ Fabrication capabilities will reduce/eliminate the need for spares through the utilization of in-situ, imported, and recycled materials in the restoration of system and element functionality, thereby decreasing risk to crew and system functionality and enhancing mission safety.
- Fabrication capabilities minimize mission risk due to equipment design flaws, by providing the capability to fabricate new parts, in situ, with updated design specifications (spares would be worthless in this case).
- Providing just-in-time fabrication of parts and tools to meet maintenance requirements of system failures via closed loop quality controlled solid freeform fabrication technologies, thereby reducing spare parts inventory.
- In Situ Repair capabilities will reduce/eliminate the need for spares through the utilization of in-situ, imported, and recycled materials in the restoration of system and component functionality.
- Repairs will minimize risk due to functional backup for critical systems and greater flexibility in recovering from failures – enabling self-sufficiency.
- Repairs will utilize shop, portable, handheld, and robotic equipment to perform functions, providing portability and ease-of-use.
- Autonomous robotic systems will reduce/eliminate man-in-the-loop requirements.
  - Will use available feedstocks which include materials delivered from Earth or materials produced in situ on moon/mars.
Current SOA for In Situ Fabrication & Repair

- **Current SOA for Multi-Material Fabrication**
  - Multiple technologies with various ranges of materials processing capabilities
  - Evolving additive techniques for solid freeform fabrication (SFF) improving yearly, with focus on multi-material & direct manufacturing

- **Current SOA for Electrical/Electronics Fabrication**
  - PCB manufacturing is multi-step process, steps include artwork preparation, developing, etching, cleaning, drilling, and finishing using subtractive techniques
  - Electronics/Electrical manufacturing require use of chemicals, metals, plastics, and resins
  - Discrete components are fabricated separately from PCB and attached in assembly build-up
  - Emerging technologies use additive printing techniques
  - Emerging material include flexible electronics - Flextronics
  - Emerging technologies are developing Thin Film Transistor Circuits (TFTC) using additive techniques

- **Current SOA Multi-Material Repair**
  - Extensive commercial, aerospace, and defense applications and adhesive materials available and in place
  - Low to extremely high temperature bonding methods possible
  - Diverse material compatibility
  - Few actual space-based toolkit single or multi-component adhesive systems applied

- **Current SOA for Electrical/Electronics Repair**
  - Current soldering methods include Standard Hot resistive Tip, Hot Air Station, Laser Soldering Station, COLDHEAT Soldering iron
  - Laser soldering repair stations are in current commercial use
  - Self-healing wire insulation proof of concept testing completed for embedded healing agent wire insulation repair
  - Concept development for wire repair using Shape Memory Alloys (SMA)
  - Concept development for wire insulation repair using viscous polyisobutane
  - All experimental runs of In-Space Soldering Investigation (ISSI) on ISS have been completed, to provide valuable data with return of experimental coupons on Shuttle RTF mission
Requirements / Assumptions for In Situ Fabrication & Repair

• Design Framework/Reference Missions
  – Infrastructure Characteristics
    • Operational Gravity: Hypo-g (Lunar 1/6-g & Martian 1/3-g) for Spiral 2
    • Operational Gravity: Hypo-g and Micro-g for Spirals 3-5
    • Operational Environment: Cabin IVA; T=10-35C, P=10-15psia
    • Operating Mode:
      ▪ Crew tended for Fabrication capability (exchange feedstock, transfer parts, perform parts cleaning, etc.)
      ▪ Crew or robotic operation for Repair capability
    • System Reliability: ≥ 95% Uptime
    • Power available up to 48 hours continuously to perform complete build cycle for fabrication capability
    • Power Requirement: TBD

• Additional Assumptions that drove the need for the capability
  – Electrical Failures comprise a high percentage of failures, based on prior mission data
  – Unpredicted Failures will always occur, introducing mission risk. Methods for correcting failures will always be a major factor for reducing mission risk
  – Crew Time will always be a premium commodity. Any autonomous repair capability will be value-added

## In Situ Fabrication & Repair

### Mission (Need Date) | Sub-Capability (Level 5 CBS) | Capability Development Needs | Current CRL
--- | --- | --- | ---
Spiral 2 Lunar Surface (2011) | Multi-Material Patching, Filling, Joining | Develop Adhesives Repair Toolkit Demo with existing adhesives for demo on ISS and/or lunar surface | 4
Spiral 3 Long Duration Lunar Surface (2014) | Multi-Material Fabrication - Fabricator | Multi-material fabricator with closed loop control in hypo-g moon capability. | 1
| Multi-Material Fabrication - Fabricator | Full scale lunar hypo-g flight unit with closed loop control and post-build finishing for pressurized cargo module launch to moon | 1
| Multi-Material Fabrication - Fabricator | Full scale system stand alone cargo element testbed for lunar surface for independent deployment ahead of manned expedition | 1
| Multi-Material Patching, Filling, Joining | Identify, develop & apply new in-situ bonding components press & unpress areas. | 1
| Multi-Material Patching, Filling, Joining | Apply learned soldering methods & technology to development of prototype portable soldering equipment for ISS | 1
| Repair – Self-Healing Wire | Develop manually activated self-healing wire insulation prototype | 1
Spiral 4 Mars Vicinity (2017) | Multi-Material Fabrication - Fabricator | Breadboard of Mars transit µ-g for CEV cabin | 2
| Multi-Material Fabrication - Fabricator | Full scale µ-g Mars transit TRL6 unit for controlled CEV cabin w/ closed loop control & post finishing; µ-g Mars transit flight unit with restricted part size up to 12x12x12 | 2
| Multi-Material Fabrication - Fabricator | Full scale system stand alone cargo element testbed for lunar surface for independent deployment ahead of manned expedition | 2
| Electronics Fabrication | Single layer printed circuit boards (PCB) with 10 micron (1e-5) features and low precision planar discrete components (resistors, capacitors, and simple sensors) | 2
| Electronics Fabrication | Single layer PCBs with 1 micron (1e-6) features and high precision planar discrete components (resistors, capacitors, and simple sensors) | 1
| Electronics Fabrication | Addition of antenna and inductor components, thermoelectric components | 1
| Electronics Fabrication | Multilayer PCBs with large scale implementation (LSI) of simple logic Thin Film Transistor Circuit (TFTC) components with 10 micron (1e-5) features (AND, OR, NAND, NOR, Invertors) | 1
| Electronics Fabrication | Addition of energy components (batteries, fuel cells, and solar cells) | 1
| Electronics Fabrication | Addition of LSI of medium complexity logic TFTC components with 10 micron (1e-5) features (MUX, Decoders, Flip-flops, Counters, and Registers) | 1
| Electronics Fabrication | Addition of LSI of complex logic TFTC components with 10 micron (1e-5) features (PLA, ROM, and FPGA) | 1
| Electronics Fabrication | Semi-autonomous test/verification and validation tester with probes for testing continuity/isolation of PCB boards; probes for basic continuity/isolation testing, voltages, and currents of PCB boards; probes for testing continuity/isolation, voltages, and currents of PCB boards | 1
| Electronics Fabrication | Autonomous Built-in-Test (BIT) test/verification and validation tester with probes for electrical testing and basic functionality of PCB boards | 1
| Electronics Fabrication | Autonomous test/verification and validation tester with probes for electrical testing and complex functionality testing of PCB boards | 1
### Mission (Need Date) | Sub-Capability (Level 5 CBS) | Capability Development Needs | Current CRL
--- | --- | --- | ---
Multi-Material Patching, Filling, Joining | CEV/Robotic performance feedback for design deltas. Technology enhancement due to ECLSS, logistics, or lander variations, etc. Complement Mars flight-unique H/W. Apply ISS lessons learned to portable flight prototype soldering equipment for Mars flight | 1
Multi-Material Patching, Filling, Joining | TRL6 Self-activating self-healing wire demo for Mars Flight | 2
Repair – Self-Healing Wire | | 1

Spiral 5 Initial Mission Mars Surface (2021) | Multi-Material Fabrication - Fabricator | Optimize functions & mass of μ-g design for Mars transit; build & test ground unit modified for transition from lunar to Mars surface gravity | 1
Multi-Material Fabrication - Fabricator | Full scale Mars version w/ optimized functionality for independent deployment ahead of manned Mars expedition | 1
Electronics Fabrication | • Refine TFTC components to medium scale implementation with 1 micron (1e-6) features, to small scale implementation with 100 nanometers (1e-7) features and to nano scale implementation with 10 nanometers (1e-8) features | 1
Multi-Material Patching, Filling, Joining | • Final integrated Mars adhesive kit contents. Flight H/W and environment compatibility. | 2

</table>
Habitats for crew and crew systems will be required to provide shelter and facilities both in transport vehicles and on the surface of the moon and Mars.

These Habitats and their systems will provide crew interfaces to all major systems as well as safe haven, recreation, relaxation, sleep, cooking, and work areas.

Habitat subsystems include Habitat Structure (vehicle, shell, structural, & in-situ components), all Internal Systems (Life support, Habitation elements, Maintenance, Safety, Racks, Systems Integration Tools & Environmental Systems), and all External Systems (Airlock, Micrometeoroid protection, Storage systems, rover accommodations).
The design and development process of exploration habitats is equivalent to that of vehicle design. An individual habitat’s structure and functionality will be driven by its specific mission’s operational requirements. Various habitat structure and styles will be required to support the exploration program. Habitat, mission scope, and vehicle design will trade requirements to meet available resources.

Habitats consist of an integrated system of systems and subsystems. Each subsystem will be chosen, per spiral, from available capabilities and traded within design resource constraints. Overall integration of designs is key to successful implementation. Each subsystem has its own defined roadmap and development process (see CBS on next page for details).
**Exploration Habitats**

**Capability Breakdown Structure**

**Surface Construction** – to be covered in ISRU Road map (Unique to Surface Habitats)

- **Habitat Shell**
  - Alloy Module (integrated)
  - Inflatable
  - Composites
  - In-Situ

**Internal Systems & Outfitting**

Environmental control Systems
- ALS (Capability Roadmaps under ALS section)
- Radiation Protection (Capability Roadmap under HHP)

Dust control/seals
- Trash processing (Capability Roadmaps under ALS section)

Lighting

Habitat Facilities
- Sleep station (including Entertainment system, sleep systems, privacy areas)
- Galley (Capability Roadmaps under ALS section)
- Exercise (Capability Roadmap under HHP)

Science & Work Stations (including mechanical and electrical repair shop, fabrication shop, computer hardware/software maintenance station, comm, & Robotics station)
- WCS (Capability Roadmaps under ALS section)
- Laundry (Capability Roadmaps under ALS section)
- Medical facility (Capability Roadmap under HHP)
- Utility centers (Included in other Capability Roadmaps)
  - (power, water, comm, data)

**External Systems and Architecture**

- Airlock (Capability Roadmap under EVA)
- Micrometeoroid protection
- Rover Accommodations (Included in other Capability Roadmaps)
- Greenhouse (Capability Roadmaps under ALS section)
Benefits

- Well designed habitats will provide for maximum crew safety
- Integrated Habitats will support overall mission success in all phases of the Manned Exploration Program
- Reconfigurable Habitat systems architectures will enable multiple configurations
- State of the art living, communication, and work centers will facilitate crew work efforts and crew-ground interaction
- Advanced life support and environmental systems (lighting, dust control, etc) will increase crew comfort, decrease the amount of required consumables, increase autonomous operations, self sufficiency, and reliability of habitats to provide for more efficient mission and crew operations
- Utilization of common hardware with other vehicles will decrease mission mass through common sparing (e.g., power, communication, instrumentation, life support, thermal control)
• Shuttle provides crew living and working environments for short duration LEO flights
• ISS provides orbital habitation facilities for 3 crew members with resupply.
• Apollo era moon lander is only existing design for a tested moon surface habitat
• Many terrestrial facilities incorporate well designed facilities necessary in a crew transport or surface habitat, but these are not micro-g or low-g designs

Exploration Habitats
Maturity Level - Capabilities

Integration Approach

1. Concept of Use Defined, Capability, Constituent Sub-capabilities* and Requirements Specified

The Capability is defined in written form. The uses and/or applications of the Capability are described and an initial Proof-of-Concept analysis exists to support the concept. The constituent Sub-capabilities and requirements of the Capability are specified.

* Sub-capabilities include Technologies, Infrastructure, and Knowledge (process, procedures, training, facilities)

Note: Assumes all ISRU external systems and gaps identified in ISRU Roadmap
Exploration Habitats Figures of Merit

• **Ultimate:**
  – Increase autonomy of habitat operations/Decrease in mission time required for habitat maintenance
  – Increased operational redundancy, usability, and reliability
  – Decreased transport mass, consumable usage, and resupply requirements
  – Decrease in likelihood of errors, effects of errors

• **Annual:**
  – Increasing percentage of human support requirements incorporated into design concepts
  – Increasing usability ratings
  – Reduction in rework required as a result of integrated testing
  – Less crew time needed for ground-based training, on-orbit training, and system procedure execution
  – Increasing reliability/maintainability (MTBF=Mean Time Between Failures, maintenance time) measures of systems
  – Progression of TRL/CRL levels of technology components
Life Support and Habitation

Key Challenges

- Uncertainty of requirements that impact LSH systems: location, duration, spacecraft resource allocation, planetary protection.
- Acquiring manifests on future space vehicles/platforms for flight testing
  - Many LSH capabilities will require validation in relevant environment of space.
  - There will be competition for limited resources on Shuttle, ISS
  - There is a lack of defined microgravity resources between ISS and Spiral 4
- Infusing lessons learned from Spiral 3 Lunar planetary surface demonstrations into capabilities under development for Spiral 4
  - Spirals 3 & 4 are closely spaced on proposed strategic timelines
  - May be resolved during upcoming interchange between Roadmap Teams
- Obtaining adequate & timely information from precursor missions that characterize local environments and *in situ* resources to infuse into capability development
- Reducing complexity of regenerative and closed loop systems, reducing equivalent system mass and improving reliability
- Adequately addressing reliability to reduce mission risk
- Development of monitoring and control capabilities in parallel with development of capabilities that will be monitored and controlled.
Life Support and Habitation Systems, including Advanced Life Support, Environmental Monitoring and Control, Contingency Response and Exploration Habitats, represents a suite of enabling capabilities necessary to support human exploration missions as outlined in the U.S. Vision for Exploration.

Advanced regenerative life support systems, with integrated components, including air revitalization, water reclamation, thermal control, solid waste management, food provisioning and biomass production, are key capabilities needed to dramatically decrease the mass of future spacecraft for human exploration and to decrease dependency on resupply.

Key aspects will include “closing the loop” to recover usable mass, utilize *in situ* resources, decrease requirements for expendables, energy, volume, heat rejection and crew time, while providing a high degree of reliability.

Remote missions far from Earth will require Contingency Response capabilities for prevention and recovery from anomalies that may threaten mission success and crew safety, including fire and hardware failure.

Vehicle and surface habitats will need additional capabilities to accommodate new environments, longer periods of service, unique mission operations and configurations, and includes focus on the habitat shell, internal systems and outfitting, and external systems and architecture.
The draft content within this progress report includes content from many different individuals within the NASA community.

Advanced EVA Systems

Presenter:
Kerri Knotts
Between this capability road-mapping effort and the previous CRAI road-mapping effort, the following individuals provided either endless technical knowledge, philosophical insight or content review:

**AEVA Systems Project:**
- JSC/Mike Rouen (AEVA LSS)
- JSC/Gretchen Thomas (AEVA LSS)
- JSC/Luis Trevino (Thermal, Airlocks)
- JSC/Joe Kosmo (Suit Pressure Garment/Mobility)
- JSC/Sandra Wagner (EP, GSS)
- JSC/Amy Ross (Suit Pressure Garment/Mobility)
- JSC/Robert Trevino (AEVA)
- JSC/Heather Paul (AEVA)
- GRC/Dave Foltz (Comm, Avionics, Informatics)
- ARC/James Hieronymus (Informatics)
- GRC/Michelle Manzo (Power)
- JSC/Lara Kearney (AEVA Program Element)
- JSC/Jeff Patrick (AEVA Program Element)
- GRC/Diane Malarik (AEVA Program Element)
- JSC/Keith Todd (Mission Operations)
- JSC/S. Rajulu (Human Factors)
- JSC/M. Whitmore (Human Factors)

**HHSS CRM EVA Review Team:**
- JSC/Glenn Lutz
- HS/Bob Poisson
- University of Maryland/Dave Akin
- JSC/CB/Mike Gernhardt
• The Advanced Extravehicular Activity (AEVA) system includes the hardware and software necessary to allow a crewperson to perform tasks outside of the primary vehicle.

• As a fundamental capability within the Exploration Super-System, the AEVA system will require System-of-Systems integration, with contributions and dependencies from across many areas such as life support, power, communications, avionics, robotics, materials, pressure systems and thermal systems.

• The complete EVA system includes the highly-integrated human-centric EVA suit, and also consists of ancillary EVA tools and equipment, EVA translation and mobility aids, rover vehicles interfaces, human-robotic interactions, vehicle sub-system interfaces, airlocks and ground support systems.

Requirements /Assumptions for Advanced EVA Systems

Various Design Reference Missions and studies were referenced during the development of this roadmap, not limited to the following:
- RTF0004/ RTF0016 (Lunar Scenarios)
- Initial Capability Roadmap Framework
- Interviews with the Apollo Lunar Surface Astronauts in Support of Planning for EVA System Design, NASA Tech Memo 108846
- Many EVA LSS related studies

Based on the current Exploration Concept of Operations (Con Ops) and Crew Exploration Vehicle (CEV) Level I Requirements, the following capabilities are needed:
- Contingency EVA capability for CEV
- Crew survivability capability and protection from vehicle depress
- Surface exploration capability

Therefore, pressurized suits are needed to support the three distinct sub-capabilities: crew protection during launch and landing, in-space contingency EVA and planetary surface exploration
- The technical challenges for these three capabilities are very different and depending on the mission, 2 or 3 suit designs may be necessary, imposing a logistical penalty

Simulators

Ground Processing Facilities
The EVA suits will support launch and entry capability, in-space contingency EVA capability and surface exploration. These highly-integrated suits will allow autonomous human operation outside the pressurized environment and contain the following critical sub-capabilities:

- Livable Pressure Containment (Pressure Garment)
- Breathable Atmosphere (Ventilation System)
  - The ventilation system capabilities include the primary and emergency oxygen systems; CO2, trace gas and humidity removal; pressure regulation; ventilation flow, as well as, monitoring, sensing, command and control and caution and warning functions
- Thermal Control: heat acquisition, heat transfer and heat rejection
- Power: power generation, power storage and power transfer
- Communications and Informatics
- Environmental Protection
- Cross-cutting System Adaptability (Vehicle Interface: CEV, LSAM, Habitats, Airlocks, Rovers)
- Self Rescue
Benefits of the Suits

• An in-space suit(s) will support launch and entry crew survivability and CEV-based on-orbit operations
• A surface EVA suit will be based on a flexible, open architecture which will support multi-destination operation with minimal system reconfiguration
• Benefits of maximizing commonality between suit designs
  – Maintainable life support system architecture that is easily reconfigurable to enable multiple destinations
  – Lightweight, highly mobile suits and dexterous gloves to increase crew productivity, enable long-duration missions and high EVA use rates, mitigate crewmember injury and fit the full range of EVA crewmember sizes
  – Integrated human-robotic work capability to increase safety, efficiency, & productivity
  – State of the art communications and computing capability for multi-media crew-ground interaction (e.g., integrated communications, high tech information systems, and heads-up displays)
  – Operating pressure regimes which decrease EVA overhead by drastically reducing or even eliminating pre-breathe protocols
  – Advanced thermal control to increase crew comfort, decrease consumables, and enable multiple destinations (e.g., aerogel insulation, active cooling and heating
  – Common hardware with other vehicle systems to increase vehicle safety & decrease mission mass through common sparing (e.g., power, communication, instrumentation, life support, thermal control)
The current state-of-the-art for this capability is the Shuttle/ISS Extravehicular Mobility Unit (EMU) and the Russian Orlan.

- The EMU is over 25 years old and is facing significant obsolescence issues. In addition, it is not compatible with the planetary environments of either the Moon or Mars and does not support the logistical requirements of long term missions.
- Similarly, the Orlan is not compatible with the planetary environments of either the Moon or Mars.

EVA overhead penalties are high in terms of mass, volume and time.

- Suit consumables are expended and require frequent replenishment or considerable time/power to recharge. No in-situ resource utilization is possible.
- Lack of suit maintenance capability beyond limited resizing, ORU replacement and consumables replacement.
- Suit mass, mobility, visibility and comfort are not compatible with partial gravity planetary environments. Inertial control and useful work/reach area in zero gravity is hampered.
- Suit protection from dust intrusion is inadequate.
- Available thermal insulation materials either only work in vacuum conditions or are thick and impede suit mobility and glove dexterity. Even with active heating, touch temperatures are limited to short durations and narrow ranges (-120 to +150°F).
- Radiation definition, monitoring and protection are inadequate beyond earth’s ionosphere.
- Sensitive environments and science devices are contaminated from suit by-products.
- Lack of integrated voice, high quality video, smart suit sensor technology, and informatics software to provide mission autonomy.

Quantitative measures will be established in the future from the results of early trade studies and requirements development. However, the following will be the high-level goals of this sub-capability:

- Decrease consumable use
- Minimize crew on-back weight
- Decrease weight and volume minimizing vehicle logistical penalty
- Increased modularity and maintainability
- Increased useful EVA work duration
  - High Work Efficiency Index (WEI)
- Maximize commonality across all Constellation vehicles
- Maximize crew comfort
EVA Tools and Mobility Aids

- Ancillary EVA tools and equipment include items that attach to a space suit, such as lighting and cameras, sensors, task-specific devices and safety gear. EVA tools, such as power and hand tools, provide the capability for a space suited human to conduct exploration and on-orbit operations. In a micro-gravity environment, EVA translation aids will be required to enable an EVA crewmember to translate, react forces and loads, and restrain themselves in order to do useful work.

- Surface exploration will require a new complement of tools for sample acquisition, archiving, and handling. Surface infrastructure (habitats, rovers, robotic assistants) will require maintenance and servicing, which will in turn necessitate handling of substantial objects in a gravitational field. This new cadre of tools will be determined as surface exploration requirements are further defined.

- Mobility aids provide the capability for controlled mobility with reduced metabolic workloads, and allow self-rescue from contingency or emergency situations.

- Technological challenges in this area are typically related to adapting existing design devices to space requirements and do not represent a huge risk to constellation planning. However, surface exploration requirements will determine the specific tool development needs.
Benefits of the EVA Tools and Mobility Aids

- Increased EVA efficiency, greater work (task) efficiency index
- Lower metabolic expenditures from physical tasks
- Increased productivity with assistance from human-interactive robotic assistants
- Task reallocation, optimizing human involvement to high payoff/high dexterity/highly complex task sets
- Greater assurance of mission success, as robotic and EVA capabilities overlap to provide multiple options for achieving mission goals
- Safer work sites, due to robotic replacement or support of EVA in hazardous or demanding tasks
Current State-of-the-Art for EVA Tools and Mobility Aids

- Current tools are limited to manual force/torque reaction and zero-gravity transport/restraint.
- There is limited environmental and mechanical analysis.
- Delicate materials are not easily handled.
- There is very limited ability to interact with spacecraft systems other than at the preplanned ORU level.
- Robotic EVA aids currently in use are primarily large positioning arms with limited mobility and dexterity. Current robotic aids are too reliant upon low-latency remote human control, and unique visual alignment targets and handling interfaces.
- Human capable rovers and dexterous robots for EVA support are conceptual and will require development by other agency experts. Interfaces to the suited crew will be defined by advanced EVA systems expertise.

Quantitative measures will be established in the future from the results of early trade studies and requirements development. However, the following will be the high-level goals of this sub-capability:

- Major reduction in tool complement supporting EVA
- Decrease weight and volume minimizing vehicle logistical penalty
- Increased commonality among Constellation vehicles
- Increased maintainability
- Lower metabolic expenditures from physical tasks
- Increased EVA efficiency (EVA work duration)
  - High Work Efficiency Index
- Increased productivity with assistance from human-interactive robotic assistants
- Maximize commonality across all Constellation vehicles
Airlocks/Pressurized Volumes

- An airlock is the system that permits an EVA crewmember to go from a pressurized space craft environment to a uninhabitable external environment
  - Hard vacuum, low pressure, toxic atmospheres
  - Microgravity, reduced gravity
- Microgravity assembly and servicing systems (non-anthropomorphic work volumes) are potential extensions of more traditional EVA, allowing use of both suit-type arms and integral robotics while maintaining the operator in a comfortable shirtsleeve environment.
- Pressurized rovers will provide a shirtsleeve habitat on a mobility platform to allow multi-day exploration sorties for the moon and Mars. The rover will also support repeated EVA operations during each sortie.
- Mobile habitats, although the design responsibility of other agency experts, enable the development of advanced infrastructure while visiting multiple science exploration sites. Habitat elements will autonomously navigate across the planetary surface between human missions, allowing reuse of surface systems at multiple locations. Interface definition will be provided by Advanced EVA discipline.
Benefits of the Airlocks/Pressurized Volumes

- Airlocks provide external access without additional operational demands on pressurized cabins to tolerate routine depressurization cycles.
- Airlocks provide separable constrained volumes to deal with dust mitigation and other contamination issues from planetary surfaces.
- Shirtsleeve microgravity assembly and servicing systems may enable extended operations in environments beyond low earth orbit, mitigating radiation and micrometeorite issues with deep space operations.
- Pressurized rovers and mobile habitats will enable extended human exploration on planetary surfaces, taking advantage of extended stay times to expand range of exploration activities.
Current State-of-the-Art for Airlocks/Pressurized Volumes

- Current airlock designs waste atmosphere and are not compatible with dust/biologic isolation.
- Dust contamination will be a significant issue on the surface of both the Moon and Mars. Dust mitigation and control must be considered in the design of planetary vehicles and EVA suit systems so that dust particles are not brought into the breathing volume. Along with dust-repelling suit technology advancements, habitat and vehicle design play a key role in preventing dust from entering the habitable volume.
- Other pressurized systems (atmospheric assembly and maintenance systems, pressurized rovers, mobile habitats) are at early TRL levels and need focused development support.

- Life Support System

EVA Tools and Mobility Aids
- In-Space EVA Tools
- EVA Surface Tools
- Human-Robotic Workaids

Airlocks/Pressurized Volumes
- Airlocks
- Pressurized Rovers
- Field Servicing System

Ground Support Systems
- Test Facilities
- Simulators
- Ground Processing Facilities
The EVA Ground Support System includes the necessary facilities and associated infrastructure to support EVA-related testing, technology development and flight program simulations and EVA system ground processing.

Ground Support Systems include:
- Component and integrated system test facilities
- Ground facilities for processing training and flight hardware
- Analogs and trainers for planetary environments for testing suit components, subsystem and integrated systems in relevant environments, proving operational concepts and conducting training.
  - Dust
  - Radiation
  - Micrometeorite
  - Biochemical
  - Pressure
  - Terrain
  - Vacuum
  - Low-gravity
  - Virtual reality
Benefits of the EVA Ground Support System

- EVA Ground Support Systems decrease technical and safety risk of human exploration by testing candidate technologies in applicable environments to validate system safety and reliability.

- EVA Ground Support Systems decrease cost risk by supporting testing of competing technologies for cost-benefit evaluation.

- EVA Ground Support Systems decrease schedule risk by providing testing of high value/high risk technologies while allowing testing of lower risk off-ramp technologies.
Because EVA testing, training, execution and ground-processing functions for previous EVA programs have been primarily run out of the Johnson Space Center, the following chart lists JSC facilities that could support Advanced EVA Systems if an upgrade plan is implemented.

- A detailed survey of laboratory capability across NASA centers, industry, and academia should be performed to create a baseline of all capability in existence at presence.
- Testing requirements for components, subsystems and integrated system testing should be performed.
- A gap analysis should be performed to identify gaps between existing capability and test requirements.
- Facility upgrades should be developed to fill capability gaps.
Current State-of-the-Art for EVA Ground Support System

- JSC facilities that could support the Advanced EVA subsystem testing if an upgrade plan is implemented:

Advanced Extravehicular Development Laboratory
- The Advanced EVA Development Lab is a "hands on" lab for development, fabrication, and test of proof of concept and new technology space suit components and mobility systems. The lab supports ground based (sea level) manned suited testing as well as unmanned life cycle, mobility, and torque range testing of suit components.

Advanced Portable Life Support System (PLSS) Lab
- The Advanced PLSS lab consists of the Ventilation Benchtop laboratory and the Thermal Loop benchtop laboratory that support the Advanced Technology Spacesuit activities. The Ventilation Benchtop is a laboratory setup to help define, try out, and design the ventilation module of the Advanced Technology Spacesuit. The Thermal Loop benchtop is a laboratory setup to test and verify the thermal loop systems for the Advanced Technology Spacesuit project.

Sonny Carter Training Facility (SCTF)/Neutral Buoyancy Laboratory (NBL)
- The Sonny Carter Training Facility provides controlled neutral buoyancy operations to simulate zero-g or weightless condition that is experienced by spacecraft and crew during space flight. It is an essential tool for the design, testing and development of the International Space Station and future NASA space programs.

Planetary Surface Simulated Field Test Site
- A JSC facility that provides a realistic 1-acre test site representative of a Mars-like strewn rock field and cap-rock hill structure to conduct a series of engineering evaluations and functionality testing of advanced space suit system mobility test activities, prototype rover vehicle driving dynamic and human-interface ergonomic studies, human/robot interactive task development activities, and advanced communications voice, video and data transmission to JSC mission control "remote science team" members. This facility enables the integrated testing of various advanced technology hardware systems that are being developed for future planetary exploration in a realistic (out-of-the-lab) terrestrial analog setting and representative of extraterrestrial surface conditions.

Reduced Gravity Aircraft
- In order to investigate human and hardware reactions to operating in a weightless/reduced gravity environment, a reduced gravity environment is obtained with a specially modified C-9 aircraft, which flies parabolic arcs to produce weightless periods of 20 to 25 seconds. The C-9 can also provide short periods of lunar (1/6) and Martian (1/3) gravity. Approximately 80,000 parabolas have been flown in support of the Mercury, Gemini, Apollo, Skylab, Space Shuttle, and Space Station programs.

Partial-Gravity Counterbalance System (PGCS) Laboratory
- A CTSD facility located at JSC (Bldg 29) that provides for the simulation of a Lunar or Mars gravity environment for conducting a wide variety of both shirtsleeve and spacesuit isolated joint mobility, system walking dynamics studies as well as engineering assessment evaluations of advanced space suit and portable life support system elements. The facility contains a treadmill that is used to conduct engineering evaluation and assessment of various planetary surface flexible boot designs while under a variety of simulated walking conditions, and reduced gravity conditions. Simulants representative of Lunar and Mars surface materials are also available for introducing more realistic surface conditions for space suit and boot material abrasion resistance and dust abatement studies.

Human-Rated Thermal Vacuum Chambers
- The six Altitude Chambers, two Thermal-Vacuum Chambers and necessary Test Support systems are utilized primarily for development, certification and parametric testing of life support systems for man in the hostile environments of space. Each of the Altitude Chambers is configured for a particular type of testing. However, within the chamber's capabilities, each chamber complex may be used to perform other types of tests.

Chamber V Thermal-Vacuum
- Chamber V is a high vacuum system consisting of a mechanical pump and oil diffusion pump. The test section is accessible through a removable bell jar. The system is configured with a guarded hot plate thermal conductance measuring system for determining the thermal performance of insulations and other materials of relatively low thermal conductance.

Building 32 Chambers
- The facility provides full scale testing of large systems and human testing/training in a high fidelity simulated space environment. In addition to the chambers, a high bay area supports test article buildup and preparation for installation into the chambers.

Maturity Level - Capabilities for EVA Ground Support System

Advanced EVA Systems Capabilities (CRL 1:5)

Suits (CRL 1:5)
- Pressure Garments (TRL 2 → 6)
- Ventilation System (TRL 1 → 9)
- Thermal System (TRL 1 → 9)
- Power System (TRL 3 → 4)
- Communication and Informatics (TRL 2 → 5)
- Environmental Protection (TRL 1 → 8)
- Vehicle Interfaces (TRL 2 → 5)
- Self rescue (TRL 4 → 9)

EVA Tools and Mobility Aids (CRL 1:5)
- In-space EVA Tools (TRL 3 → 7)
- EVA Surface Tools (TRL 1 → 9)
- Human-Robotic Work-aids (TRL 2 → 5)

Airlocks/Pressurized Volumes (CRL 1:5)
- Airlocks (TRL 2 → 5)
- Pressurized Rovers (TRL 2 → 3)
- Field Servicing System (TRL 2 → 4)

Ground Support Systems (GSS) (CRL 1:5)
- Test Facilities (TRL 3 → 9)
- Trainers and Simulators (TRL 3 → 9)
- Ground Processing Facilities (TRL 3 → 9)

*CRL shown is in terms of the starting/ending level (to TRL 6). TRL shown is the range covered in that technology area.

Quantitative measures will be established in the future from the results of early requirements development. However, the following will be the high-level goals of this sub-capability area:

- Maximize reliability
- Maximize maintainability
- Maximize safety
- Maximize operational life time
- Maximize evolvability
Key technical challenges:

- Major challenges in meeting required technologies/capabilities
  - Exploration Concept of Operations and Architecture
    - Number of crew
    - Vehicle configurations
    - EVA operational requirements
  - Vehicle pressure versus suit pressure
    - Suit operating pressure
    - EVA prebreathe time
  - Anthropometric size range
  - Integration with other Constellation systems

- Alternatives or off ramps
  - Number of suits to support spirals is a major decision point that drives the rest of the roadmap
EVA Critical Capabilities for Exploration

- Highly-integrated human-centric EVA suits for in-space operations and planetary surface operations
- Task efficient EVA tools and equipment
- Safe and effective EVA translation and mobility aids
- Human-interactive robotic assistants and human-centric rover vehicles interfaces
- Standard EVA sub-system interfaces
- Functionally efficient airlocks
- Ground support systems that effectively produce, test, train and maintain EVA systems
Back Up
The Bioastronautics Roadmap guides the prioritized research and technology development that, coupled with operational space medicine, will inform:

- the development of medical standards and policies;
- the specification of requirements for the human system;
- the implementation of medical operations.

The Roadmap provides information that helps

- establish tolerances (i.e. operating bands or exposure limits) for humans exposed to the effects of space travel and develop countermeasures to maintain crew health and function within those limits; and
- develop technologies that make human space flight safe and productive.

1 Concept of Use Defined, Capability, Constituent Sub-capabilities* and Requirements Specified

The Capability is defined in written form. The uses and/or applications of the Capability are described and an initial Proof-of-Concept analysis exists to support the concept. The constituent Sub-capabilities and requirements of the Capability are specified.
Sub-Capabilities* Demonstrated in a Laboratory Environment

Proof-of-Concept analyses of the Sub-capabilities are performed. Analytical and laboratory studies of the Sub-capabilities are performed to physically validate separate elements of the Capability. Analytical studies are performed to determine how constituent Sub-capabilities will work together.
Sub-Capabilities* Demonstrated in a Relevant Environment

Sub-capabilities are demonstrated with realistic supporting elements to simulate an operationally relevant environment to the Capability.

- of appropriate scale
- functionally equivalent flight articles
- major system interactions and interfaces identified
Integrated Capability Demonstrated in a Laboratory Environment

A representative model or prototype of the integrated Capability is tested in an ambient laboratory environment. Performance of the constituent Sub-capabilities is observed in addition to the Capability as an integrated system. Analytical modeling of the integrated Capability is performed.
Integrated Capability Demonstrated in a Relevant Environment

An integrated prototype of the Capability is demonstrated with realistic supporting elements to simulate an operationally relevant environment to the Capability.

- of appropriate scale
- functionally equivalent flight articles
- all system interactions and interfaces identified
Integrated Capability Demonstrated in an Operational Environment

The Capability is near or at the completed system stage. The integrated Capability is demonstrated in an operational environment with the intended user organization(s).

- full scale flight articles
- demonstrated in the intended operational ‘envelope’
Capability Operational Readiness

The Capability has been proven to work in its final form under expected operational condition. This level represents the application of the Capability in its operational configuration and under “mission” conditions.

-heritage? (multiple missions…?)
