

ORGANIZATION, MANAGEMENT AND FUNCTION OF INTERNATIONAL SPACE STATION (ISS) MULTILATERAL MEDICAL OPERATIONS

J. Michael Duncan, Valery V. Bogomolov

Filippo Castrucci, Yu Koike

Jean-Marc Comtois, Ashot E. Sargsyan

Beijing, May 2007

A Multilateral Operational System

ISS is unique and highly successful in terms of creating an international operational medical system

Purpose of Space Medicine

For every mission / crewmember

Protecting and improving health and performance

Preventing long-term health consequences

Responding to trauma or illness

Long-Term

Improving medical capabilities in microgravity

Advancing knowledge in space medicine

Advancing the practice of medical telemetry and telemedicine

Preparing for future missions

Over 40 years' Experience

In search for solutions, space medicine has been developing, using, and promoting advanced technologies to deliver health care.

During the last decade, space medicine experts from several nations have shared a common goal of supporting the ISS Program

Salyut, MIR, Skylab Stations

Short-Duration Missions

Growing own experience base

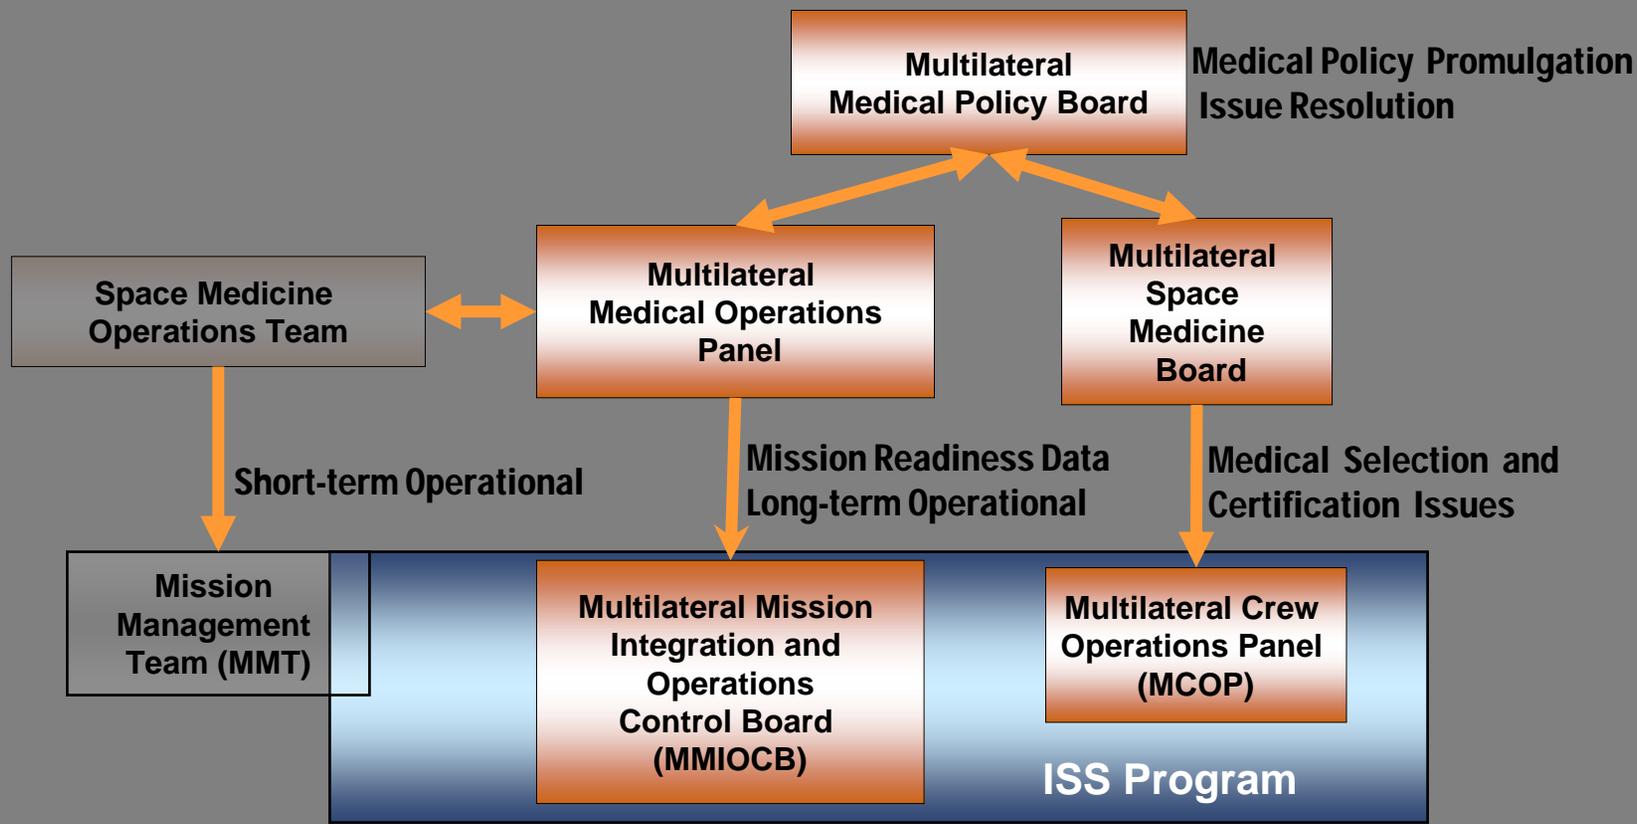

SECTION I: ISS MEDICAL ORGANIZATION

ISS Medical Authority Structure

- **Multilateral Medical Policy Board (MMPB)**
- **Multilateral Space Medicine Board (MSMB)**
- **Multilateral Medical Operations Panel (MMOP)**

NASA

CSA

ESA

JAXA

FSA

Multilateral Medical Operations Panel (MMOP) - 4 Phases

- 
1. Initial period: Oct. 1995 – 1996
 2. Pre-Operational period: 1997 – 2000
 3. ISS Early Operations: 2000 – Assembly Complete
 4. ISS Routine Operations: 2008 – Lifetime

Initial Period 1995-1996

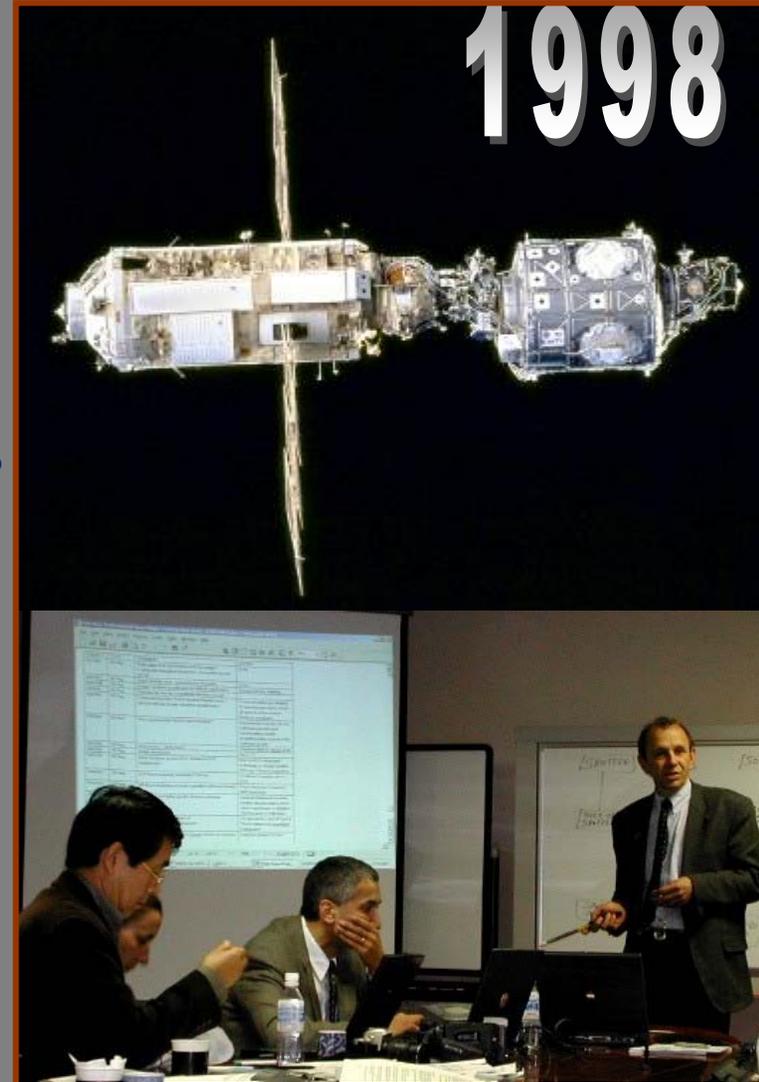

- **Challenges**

- Different medical cultures and standards of care
- Diverse medical backgrounds, training, and experience
- Different expectations about ISS medical system
- Different management structures
- Variable funding levels
- Expected to operate by consensus

Pre-Operational Period (1997-2000)

- Build a unified team
- Establish relationship with the engineering community
- Develop joint operational concepts
- Develop requirements and standards acceptable to all partners and the ISS Program management
- Develop implementation plans and other documentation
- Activate MMOP working groups
- Share experience and knowledge

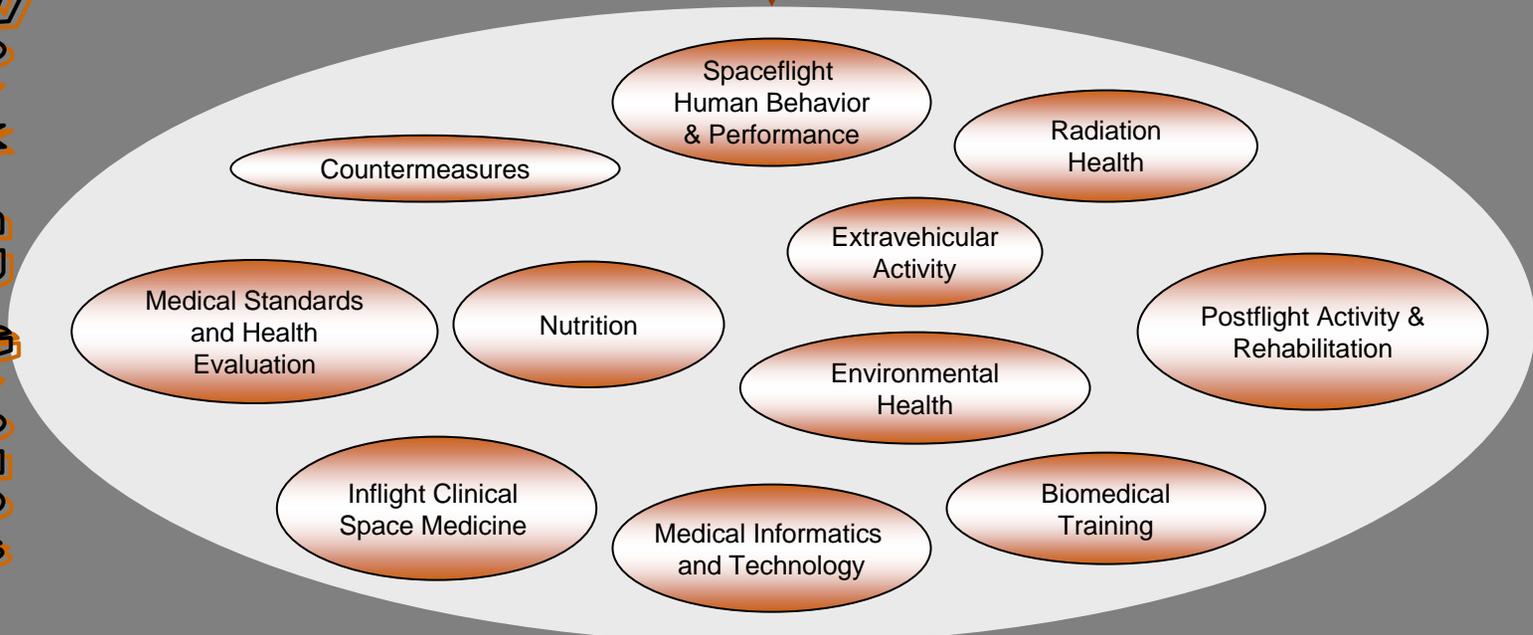

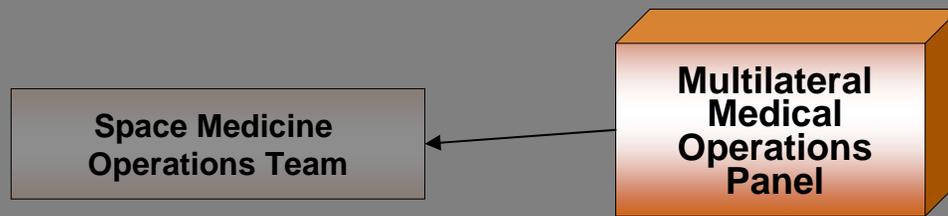

Operational Period

- MMOP functions as a Working level body for coordinating partner inputs for ISS medical operations
- Develops medical standards and requirements
- Establishes medical operations implementation plans
- Establishes crew biomedical training programs
- Establishes flight surgeon training programs
- Oversees medical data handling issues

Multilateral Medical Operations Panel Structure

WORLDWIDE

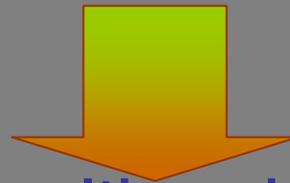

MMOP in ISS Operations

- Management of further integration of all partners
- Multilateral consideration of Partner-initiated input into ISS medical operations
- Development of multilateral consensus medical position on programmatic issues (e.g., on planning of missions > 180 days)
- Development of multilateral inputs into ISS medical or medically relevant documentation, and multilateral document control
- Provision of medical input into the ISS Program on a regular basis; regular reports to ISS MIOCB

MMOP Products

- ISS requirements documentation
 - Medical (operations, medical evaluation, etc.)
 - Pertinent sections of other space station documents
 - ISS ground rules and scheduling constraints
 - ISS operational flight rules
 - Increment – specific requirements
- Implementation plans and other documentation

- Crew health and safety
- Medical risk mitigation

Supervision and Adjustment of Routine Operations

Weekly Space Medicine Operations Team (SMOT)

Weekly coordination and status/issues

- Crew health and well-being, work/rest schedule
- Hardware, medical procedures, environment, radiation
- Data management and exchange
- Generation of medical input for the ISS Mission Management Team (MMT) and short-term planning
- Any urgent matters and announcements, problem resolution
- Readiness for events, “look-ahead” reviews

Has taken place >330 times (as of May 2006)

Medical Certification: ISS Multilateral Space Medicine Board

- Review and approval of medical certification for duty on ISS
- Credentialing and certification of physicians to practice space medicine on ISS

ISS has joint Medical standards are common for all

- **Space flight eligibility standards**
- **Medical selection and periodic evaluation requirements**
- **Pre-, in- and postflight evaluation requirements**
- **Medical standards and evaluation requirements for Space Flight Participants**

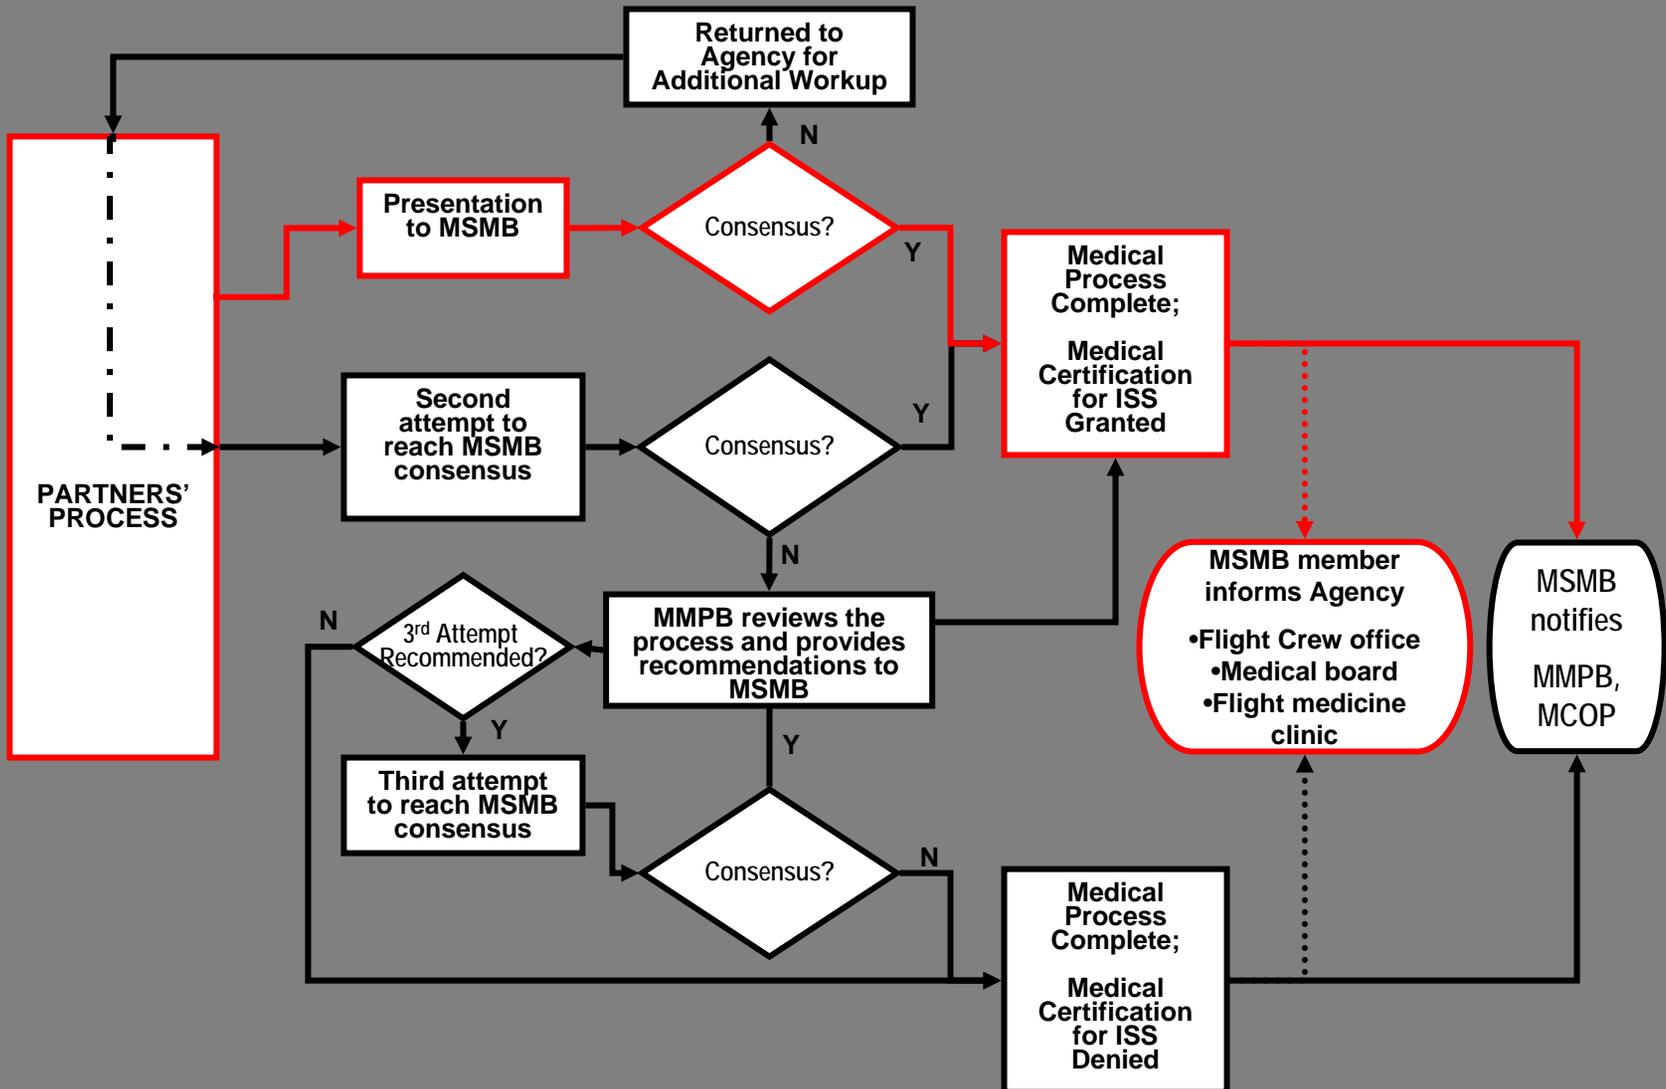

Principles of ISS Certification

- Common standards and evaluation requirements
- Common responsibility for health and well-being of crews and mission success
- Independence of administrative influence
- Common presentation format
- Full disclosure of available data
- Meticulous clinical review / discussion
- Increasing use of terrestrial and space evidence
- Multilateral decision-making **by consensus**
- Building new knowledge through learning from each other and sharing expertise

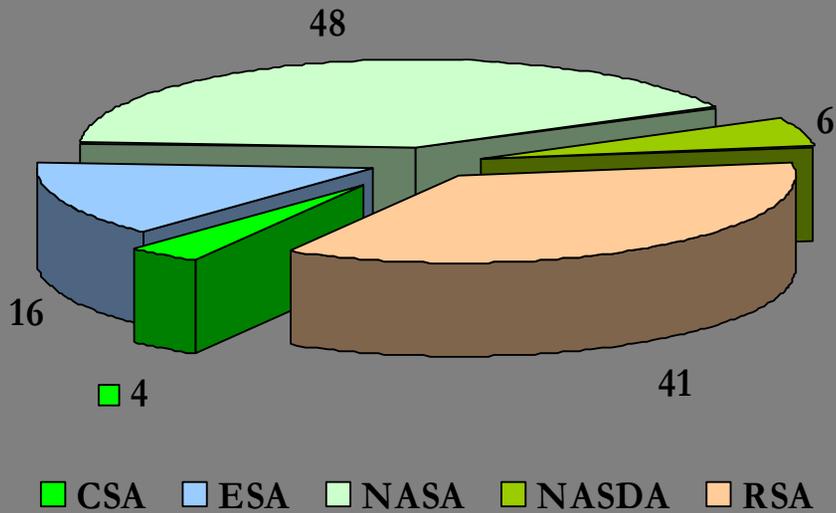

Multilateral Certification Process

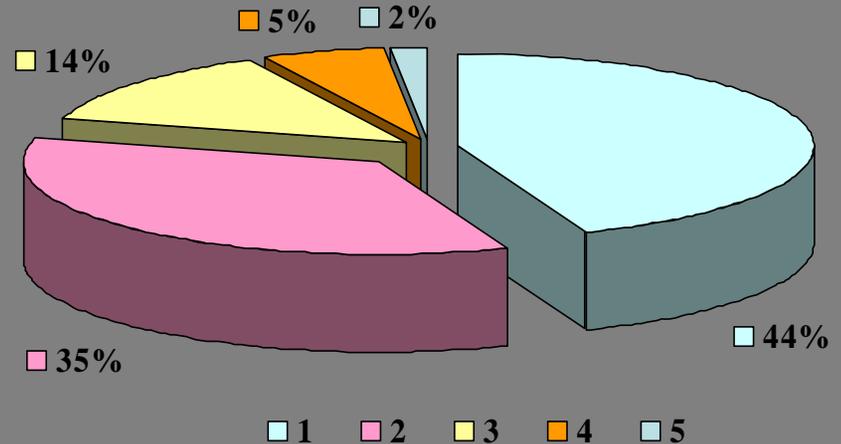

Crew Certification Data (to be updated)

Distribution
by Agency

Events Per
Individual (%)

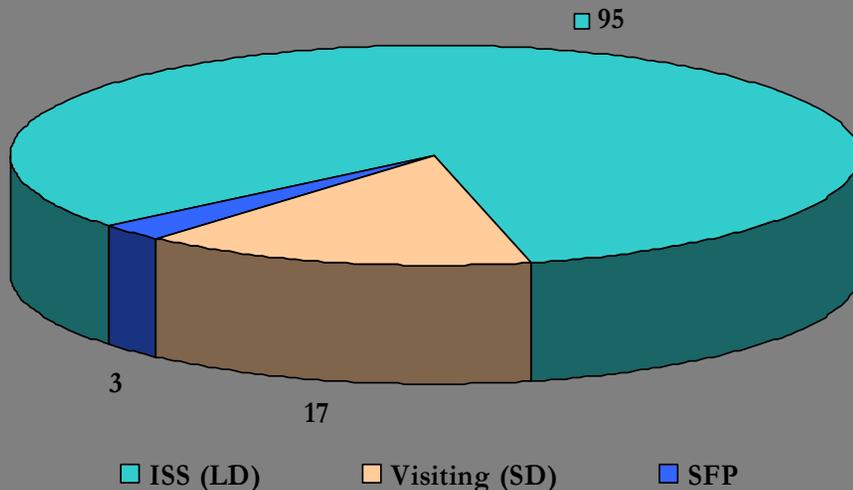

- Total number of individuals: 115
- Total number of certification events: 210
 - Average : 1.83 events per person

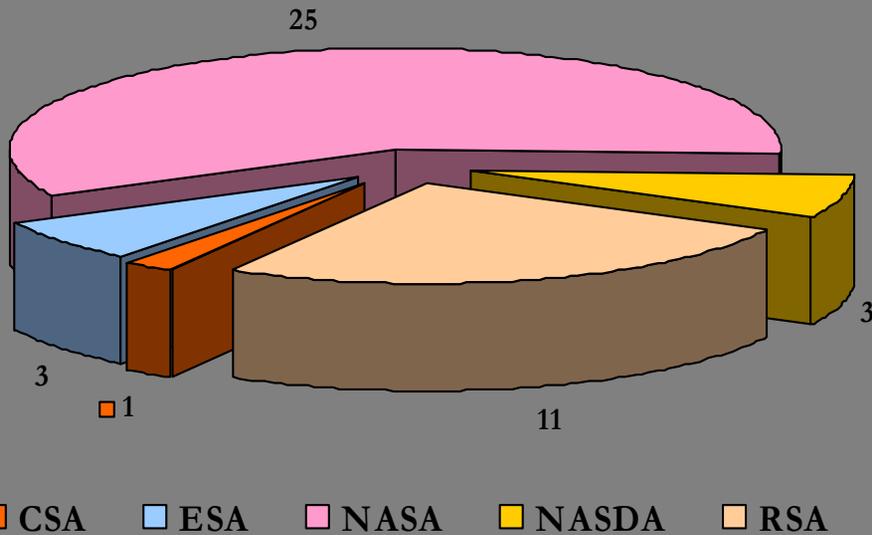

Distribution by Standards Applied

- Long - Duration Space Flight (ISS Crewmembers or candidates)
 - (30 – 180 days)
- Short - Duration Space Flight (Soyuz or Shuttle crewmembers) to visit ISS (up to 30 days)
- Space Flight Participants to visit ISS (Individuals who are not astronauts or cosmonauts by profession)

Flight Surgeon Certification by Agency

Distribution by Agency

Total number of ISS Flight Surgeons: 31

SECTION II: ISS MEDICAL OPERATIONS

Expeditions 1 - 14

- 14 missions aboard the ISS were completed successfully
- The health outcomes of ISS missions continue to be favorable
- Nominal mission duration = 180 days

Exp.15 “core” launched in April 07

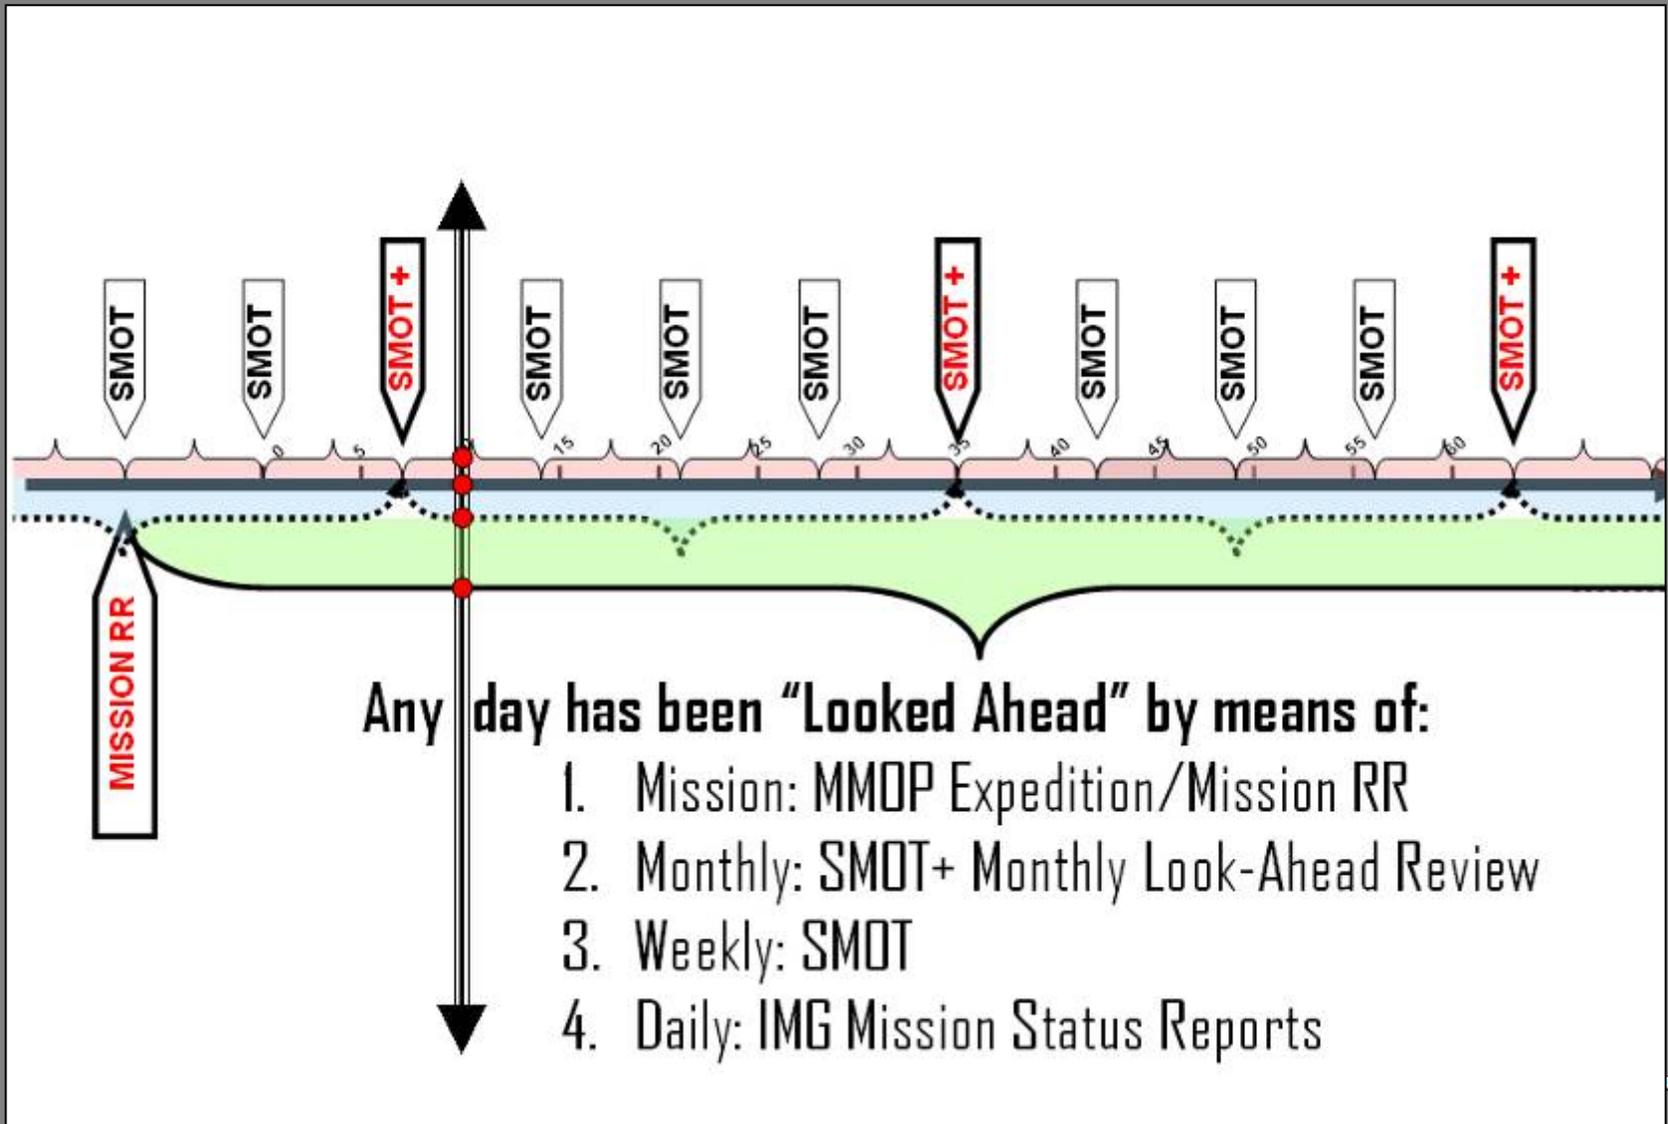

Medical Launch Readiness Checklist Areas

- Crew medical certification and clearance for launch
- Crew training
- Capabilities for evaluation and monitoring of crew health and performance
- Capabilities for diagnosis and treatment
- ISS environment and capabilities for environmental monitoring
- Capabilities for sustaining human health (in-flight countermeasures, food and water supply, compliance with crew day planning requirements and work-rest schedule limitations)

Mission Status and Readiness Reviews

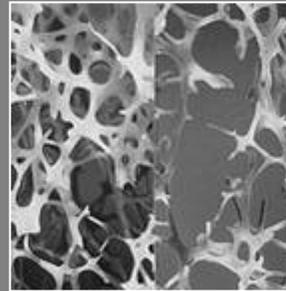

The Integrated Medical System

- 
- This concept of the Integrated Medical System (IMedS) goes beyond nomenclature; it is in fact the way ISS Medical Operations works
 - All operational medical equipment and systems are considered part of IMedS, regardless of their origin
 - Most medical operations equipment contributed by Partners is mutually complementary, with certain redundancy for critical systems

Example: The System of Countermeasures

Maintaining and Upgrading the Integrated Medical System

Example: OUM/PFE

- Has been used successfully for 3 PFEs

Transition to Multilateral Crews

- STS-121 delivered an ESA astronaut to the ISS
- T. Reiter's / Astrolab mission marks a transition towards multilateral crews

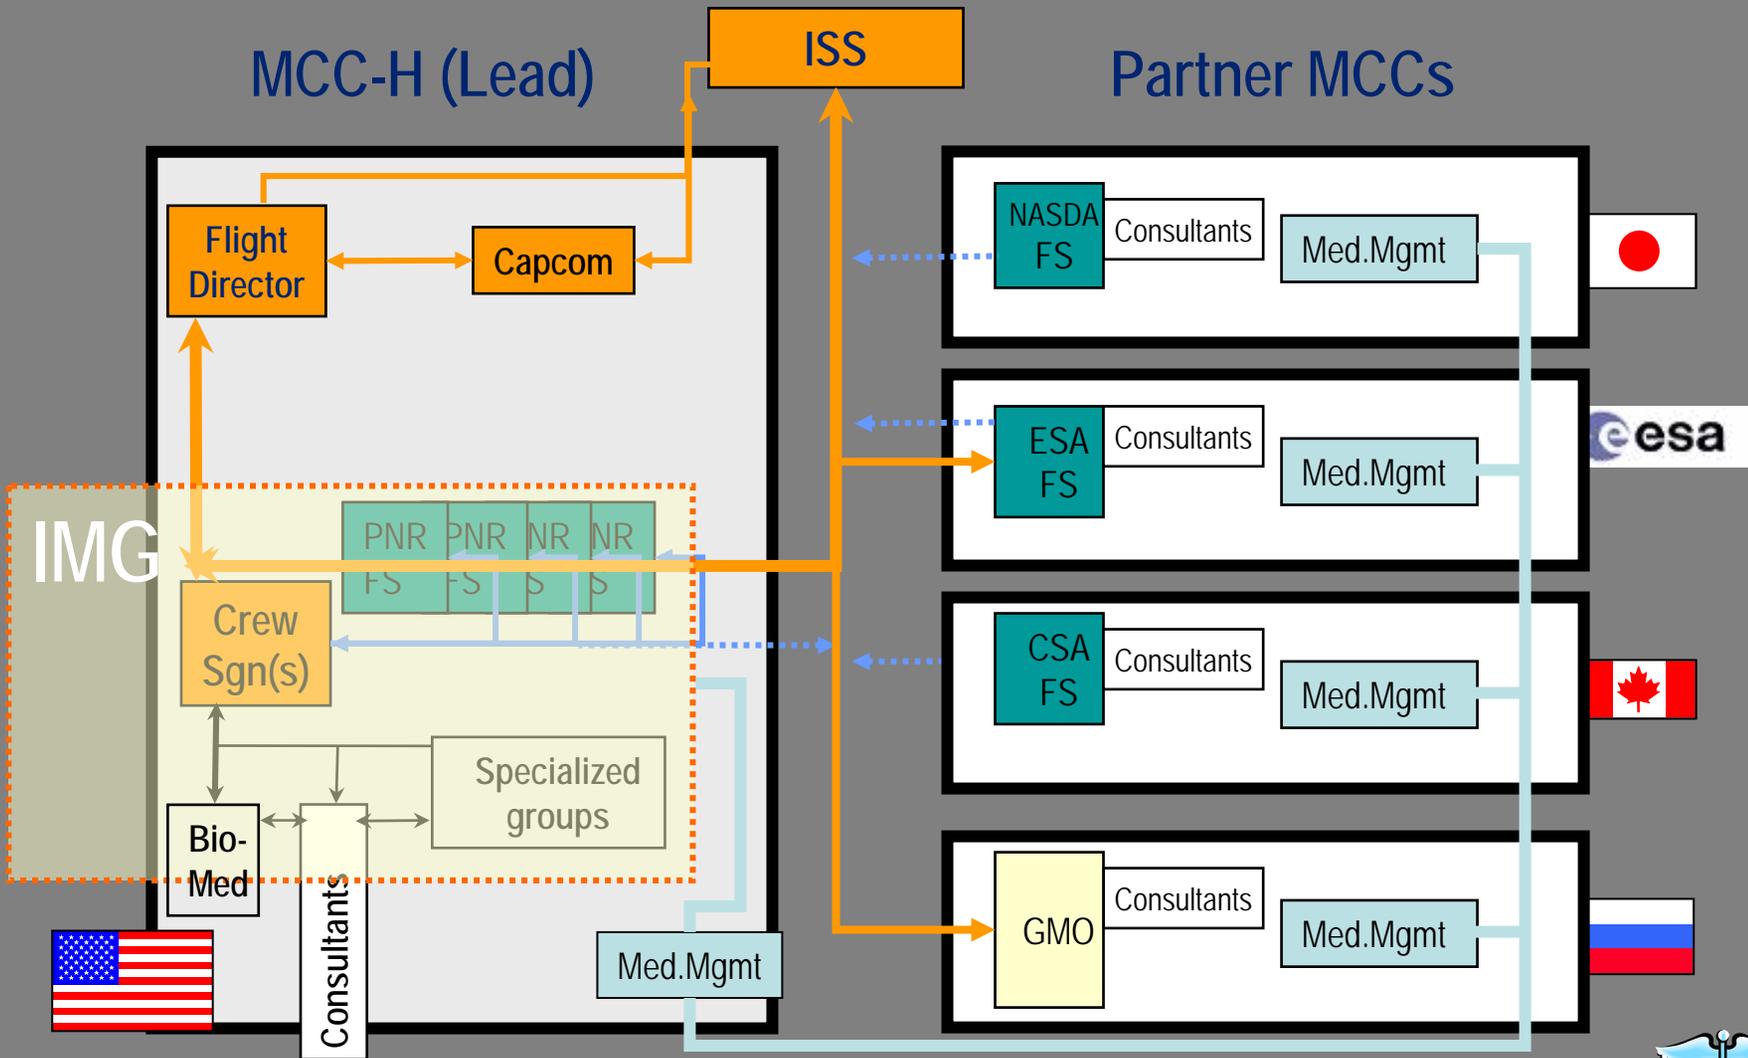

Partner “Concepts of Operation”

- In the foreseeable future, JAXA, ESA and CSA astronauts will serve as ISS crewmembers
- Each Agency has largely similar sets of solutions for the medical support of their astronaut
- We expect considerable expansion of the current Integrated Medical Group and contribution from other Partners into joint Medical Operations
- The expected increase in the size of the crew will pose new challenges and require efforts to revisit and re-validate many aspects of the system

Operational Integration

Summary for Section II

- The ISS Program continues to receive consensus input on the medical operational aspects of the ISS Program
- In the limited- resource environment of the ISS, a high degree of integration allows to maintain all the necessary capabilities to maintain crew health and safety and ensure favorable medical outcomes
- The ISS medical organization is building valuable evidence base for the space medicine of future

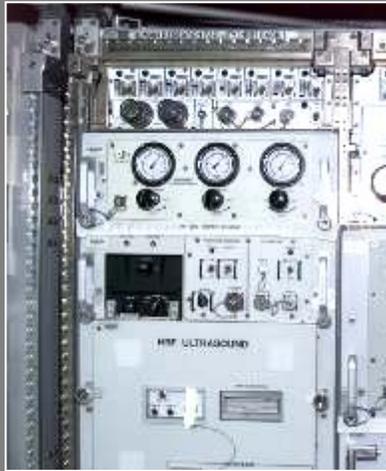

**SECTION III: OPERATIONALLY
ORIENTED RESEARCH,
TECHNOLOGY DEVELOPMENT,
AND FUTURE MISSIONS**

Telemedicine Methodology for ISS: Diagnostic Imaging

PLACE THE PROBE IN THE C2 POSITION POINTING UPWARDS IN THE DIRECTION OF THE RIGHT SHOULDER. THE MARKER POINTS TOWARDS 3 O'CLOCK.

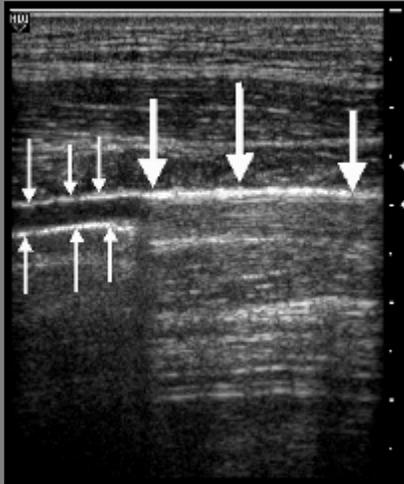

BACK SPACE NEXT SPACE

The image shows a software interface for cardiac scanning. On the left is a vertical menu with various options. In the center is a 3D anatomical diagram of a human torso, showing the ribcage and heart. A probe is positioned on the right side of the chest, labeled C2. The diagram is part of a software interface for cardiac scanning. On the right side of the interface, there are several panels: 'CARDIAC SCANNING POSITIONS' with buttons for C2, C3, and C4; 'ULTRASOUND' showing a live scan of the heart; 'DETAIL' showing a close-up of the heart; and 'POSITION DESCRIPTION' with instructions for probe placement. At the bottom, there are navigation buttons: 'BACK', 'SPACE', 'NEXT', and 'SPACE'.

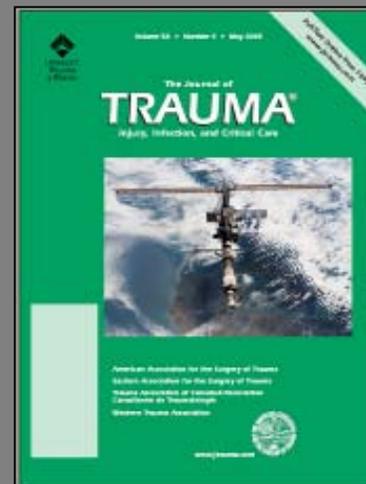

New Diagnostic Methods and Approaches

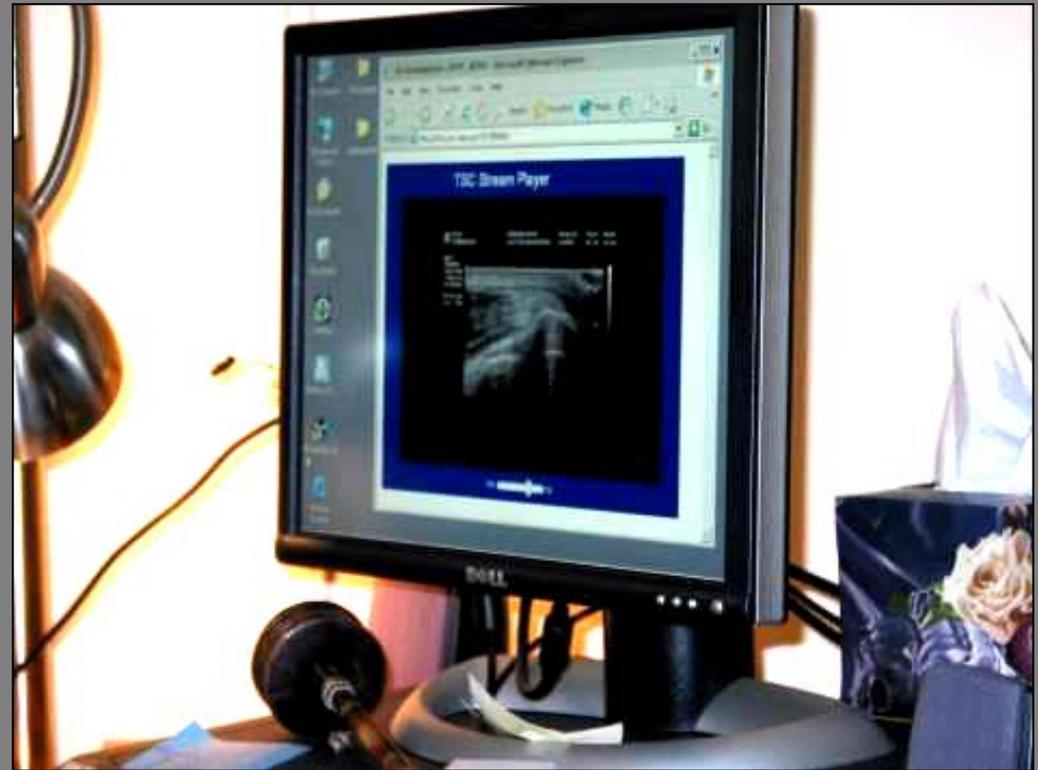

Hemothorax

Pneumothorax

Use of Internet for Remote Consultant Capability

Duration-Related Human Health Concerns

Behavioral Health & Performance

Extended duration influences human behavior and performance
Family separation , missed personal goals and milestones
Stress from multiple factors

Clinical Care Capability

Extremely limited ability to treat significant conditions on orbit, with further reduced medical care during return

Human Adaptation & Countermeasures Issues

Countermeasures not validated
for deconditioning effects of extended duration spaceflight

Habitability and Environmental Issues

Radiation Effects are duration dependent (cancer and non-cancer)
Regulatory radiation exposure limits
High noise level in spacecraft may impair hearing
Environmental sample and nutrition concerns with longer resupply cycle

The Future of Space Medicine

- **As part of the work for ISS and future missions, technologies are / will be adapted or created in:**
 - **Medical informatics**
 - **Smart medical and environmental sensors**
 - **Decision support systems**
 - **Medical data / image compression and handling**
 - **New teaching aids - enhanced training, skill retention, and just-in-time performance enhancement**
 - **Virtual presence technologies and adaptive expertise delivery (remote guidance) systems**
 - **Noninvasive and minimally invasive diagnostic and treatment procedures**
 - **Novel solutions in preventive medicine**

LAB151
