Mission Support

On-orbit Flight Control Room (FCR) Staffing

Surgeon Console - FCR
• **Current ISS Prebreathe Protocols**
  - Four hour In-suit (Originally accepted by testing. Currently acceptable by analysis)
  - Campout (Accepted by analysis of related data/similarity to shuttle 10.2 psi staged protocol)
  - Exercise Prebreathe (Accepted by testing utilizing the criteria below)

• **Accept Criteria for ISS EVA Prebreathe Protocols***
  - One-year “DCS Risk Definition & Contingency Plan” effort designated accept criteria of research protocol
    » Decompression Sickness (DCS) < 15 % at 95% CL
    » Grade 4 Venous Gas Emboli (VGE) < 20 % at 95% CL
    » No Type II (serious) DCS

*This criteria was not applied to the shuttle protocols*
• Operational Experience
  – To date, there have been 141 person-EVAs conducted with 10.2 psi Staged PB Protocol
    » 12-16 hr stay at 10.2 --- 20 Final PB
      » 75 min
    » 16-20 hr stay at 10.2 --- 4
    » 20-24 hr stay at 10.2 --- 12
    » 24 hr > stay at 10.2 ---- 105
    » 40 min
  – In no case has there been any reported symptoms or signs of DCS
Spaceflight Decompression
Sickness Contingency Plan

Medical Operations
Dr. Joe Dervay

OBJECTIVE:

• Develop enhanced plan to diagnose, treat, and manage on-orbit DCS
  – Achieve new level of DCS awareness among flight controllers, astronauts, and the medical community

• Historically, few drivers to modify existing plan

• Significant upcoming increase in EVA activity to build and maintain ISS - “Wall of EVA’s”

• Important to involve International Partners with plan
**APPROACH:**

- Johnson Space Center multi-disciplinary team: Medical Operations, Astronaut Office, EVA Office, Mission Operations Directorate

- Consultation with military, civilian, and commercial experts

- Review of literature and databases

- Analysis of past Mission Control “Simulation” scenarios

- Overall plan reviewed by expert committee chaired by Dr. Lambertson (1998)
DCS Contingency Plan

- EVA Checklist Development
- Improved On-Orbit DCS Treatment
- DCS Flight Rules Development
- Ground Support Infrastructure
- DCS Disposition Policy

- Shuttle / EMU
- ISS / EMU
- Russian / ORLAN

- Insuit Treatment
- BTA Mods
- Hyperbaric Chamber Technology Dev.
- Adjunctive Drug Therapy

- Mission Control DCS Simulation Program
- Crew Flight Surgeon Training

- Primary Hyperbaric Landing Sites
- Cooperative USAF/NASA Programs
- Russian EMS Plan
EVA “CUFF CLASSIFICATION” SYSTEM:

- Simple operational classification of DCS symptoms relevant to EVA crewmember
- Provides clear communication of symptoms and associated operational response.
- Defines actions required to place payload in safe configuration and repress affected crewmember
- Sensible system to encourage symptom reporting
# EVA CUFF CLASSIFICATIONS

<table>
<thead>
<tr>
<th>Cuff Class</th>
<th>Symptoms</th>
<th>Response</th>
<th>Rationale</th>
</tr>
</thead>
</table>
| 1 | **Mild pain**, at single or multiple sites and/or single extremity paresthesia. Difficult to distinguish from suit pressure points.  
*Symptoms do not interfere with performance.* | Report in post EVA PMC. No future EVA impact. | 1-8 |
| 2 | **Moderate cuff 1 symptoms that interfere with performance.** | Terminate EVA for both crew members, perform worksite clean-up only, minimize activity of affected crew member. Perform repress.  
*Set up PMC post repress.* | 3,6 | 9-10 |
<table>
<thead>
<tr>
<th>Cuff Class</th>
<th>Symptoms</th>
<th>Response</th>
<th>Rationale</th>
</tr>
</thead>
<tbody>
<tr>
<td>3</td>
<td>Severe cuff 1 symptoms or migratory, trunkal or multiple site paresthesia, unusual headache.</td>
<td>Terminate EVA. Assisted return of affected crew member to airlock, buddy perform worksite safing, then airlock repress. Set up PMC.</td>
<td>12, 13</td>
</tr>
<tr>
<td>4</td>
<td>Serious symptoms – Central neurological, cardiopulmonary.</td>
<td>Abort EVA. Crew assisted return to airlock. Repress affected crew member. Buddy perform worksite safing, then airlock depress, repress. Set up PMC.</td>
<td>14-19</td>
</tr>
</tbody>
</table>
RATIONALÉ:

- Spacesuit itself creates pressure points, joint pains, and local paresthesias
- Majority of pain symptoms (86%) in historic database improved or remained the same with time
- Low risk of mild or moderate symptoms progressing to serious
- Worksite safing important for potential Shuttle de-orbit as well as Station operations
- May require 30-45 min. transit to airlock from worksite location
- With serious symptoms, may need to repress affected crewmember ASAP while solo crewmember completes clean-up tasks
TREATMENT PHILOSOPHY:

- Oxygen, pressure, and time are definitive measures
  - Fluids and medications are adjunctive

- Provide higher pressures and longer times than proven 2-hr. Ground Level Oxygen (GLO) – treat gas phase, not just symptoms

- Avoid breaking suit integrity for 20-30 min. for installation of Bends Treatment Apparatus (BTA) [increases suit pressure to 8 psi]

- Development of treatment flows, extensions

- Conversion into Malfunction (MAL) Procedures

- Enhanced Medical Checklist
  - Aftercare
  - Addresses late and recurrent “hit”
Terminate EVA; In Airlock on SCU

If STS at 10.2 psi

Stay in Press Mode
20 Min in Suit
(10.2 + 4.3 = 14.5 psi)

Remain in Suit
Additional 160 Min.

Doff Suit

- CMO PE/Neuro Check
- Hydrate (Isotonic Fluid po, 1 liter/hr)
- Limit activity
- PMC

Sx Resolved

No Rx Required

Aftercare
- RTD 24 Hrs.
- Medical Check Prior to EVA
(72 Hr)

If STS at 14.7 psi

ISS at 14.7 psi

Repress STS to 14.7 psi

Remain in Suit 150 Min.
(14.7 + 4.3 = 19 psi)

Sx Unresolved, Worse or No Change

20 Min. Extension

Sx Unresolved, Worse or No Change

Block 1

(-) 2 Hr O₂ by Mask

If any symptoms remain, Check MCC/PMC
(Possible Additional O₂, BTA, Orlan Ops.)

Sx Resolved

Block 1

Aftercare
- Periodic Medical Eval.
- RTD 24 Hr.
- Reduced Pressure/EVA
(Case by Case)
(72 Hr. - 7 Days)

Sx Resolved

20 Min. Extension

Sx Unresolved, Worse or No Change

Doff Suit

No Rx Required

Stay in Press Mode
20 Min in Suit
(10.2 + 4.3 = 14.5 psi)

Remain in Suit 150 Min.
(14.7 + 4.3 = 19 psi)

Sx Unresolved, Worse or No Change

20 Min. Extension

Sx Unresolved, Worse or No Change

Block 1

Aftercare
- RTD 24 Hrs.
- Medical Check Prior to EVA
(72 Hr)
20.1 DCS TREATMENT

1. Determine Cuff Class
   - Cuff Class 1
   - Cuff Class 2 or 3 (Report to MCC)
   - Cuff Class 4 (Report to MCC)

2. Continue EVA.
   - If symptoms resolve upon REPRESS, go to Cuff Class 2
   - Report to Surgeon next PMC

3. Terminate EVA (Cuff CL 7)
   - Unaffected crewmember slow safety tether, perform worksite cleanup and/or PLB safety
   - MCC for PLB config
   - Perform INGRESS (Cuff CL 4)

(1) (2) (3)

4. NOTE
   - DO NOT perform POST EMERGENCY REPRESSION
   - Abort EVA (Cuff CL 6) with ingress assist from unaffected crewmember
   - Unaffected crewmember perform PLB safety

If single crewmember abort
   - Cutler hatch Equal vlv caps (two) - remove

   - Unslow resuscitator from SOMS (MED C1), CPR STATION, OXYGEN SUPPLEMENTAL (SUPPLEMENTAL)

   - Crewmember conscious? 
     - NO
     - 14

   - Can crewmember speak in full sentences w/o respiratory distress? 
     - NO
     - 13
     - 10
     - 9

   - Leave O2 ACT PRESS for 160 min
   - CMG report changes in DCS symptoms per DCS exam criteria to Surgeon as requested

5. Perform LCH REPLACEMENT
   - CREWMEMBER IN SUIT EMU CONT DCS, omitting steps 3, 17, 18

6. Cap P < 10.2?
   - NO
   - 11

   - Perform 10.2 PSI MAINTENANCE
     (10.2 PSI CABIN)
   - Leave O2 ACT PRESS for 20 min
   - DCS signs or symptoms resolved?
     - YES
     - 13

   - Leave O2 ACT PRESS for 20 min
   - CMG report changes in DCS symptoms per DCS exam criteria to Surgeon as requested

06/16/99 FS.20-7 EVA/101/BAS
Medical Operations
Sickness Contingency Plan
Dr. Joe Dervay

DCS Neurological exam:

- Simple exam to assess symptoms, and follow over time (in-suit & out-of-suit)
- Can be performed by non-physician Crew Medical Officer (CMO)
- Challenge to perform exam with patient in the suit

Spaceflight Decompression
Spaceflight Decompression Sickness Contingency Plan
MEDICAL KITS

• IV Fluids
  – Shuttle: 3.1 liters normal saline
  – ISS: 12.1 liters normal saline

• Medication
  – Compiled to cover broad range of potential conditions
    » Includes limited quantities of Dexamethasone and Lidocaine

• ISS Respirator – Autovent 2000 (Allied Health)

• ISS Defibrillator – PD 2000 (Zoll Medical)
FLIGHT RULES:

- Pre-established rules for Flight Control Team to respond in coordinated manner
- Avoid miscommunication across multiple disciplines
- Documents Cuff Classes, deorbit requirements to Primary Hyperbaric Care site (3 CONUS, Hickam, Guam), deorbit within 10 hrs. for unresolved Type II symptoms
TRAINING:

• Astronauts
  – MAL checklists
  – New class on Medical Evaluation of DCS
    » Physiology, symptoms, treatment, neuro exam
    » Video of DCS Neurological exam

• Flight Surgeon/Biomedical Engineer
  – DCS syllabus, console requirements, CME courses

• Mission Control Simulations
DCS EMERGENCY LANDING SITES

• Primary Hyperbaric Care Landing Sites
  – Chamber capabilities, proximity to trauma center, points of contact being coordinated with DDMS medical personnel

• Russian Landing Site Capability and Response
  – Work in progress to further document plan

<tr>
<td>Rep</td>
<td>15:17</td>
</tr>
<tr>
<td>POST EVA w/o H2O</td>
<td></td>
</tr>
</tbody>
</table>

* It is possible to perform METOX Change-Out (manned) to allow for maximum EVA PET capability. Provided that Crew Day Length violations can be approved, we could support a 6:30 EVA PET.

Note: Assume depress pump and EMERG MPEV & AL VAJ; 30 min C-Lk depress without built in hold at 5psi. With 2 hours of Pre-sleep, **STS Crew Day length = 17:17**.

### EVA DAY SUMMARY

- Post Sleep (1 hour 15 mins total)
- EVA Prep (1 hour 30 mins)
  - EVA Prep for Donning (30 mins)
  - Suit Donning at 10.2 (1 hour)
- Suit Purge (12 mins)
  - Airlock Repress to 14.7
- In-suit Prebreathe (4 hours)
- Crewlock Depress to vacuum (30 mins)
- EVA tasks (6 hours 30 mins)
- Airlock Repress (20 mins)
- Post EVA without EMU H2O Recharge or METOX Regeneration (1 hour)
- Pre Sleep (2 hours)
### CEVIS Exercise Protocol Timeline

#### A/L Dep (15 min)

- 60 min Mask PB
- *12 HOURS AT 10.2 psi
- 10.2 Dep
- 45 min before 12.5
- EVA PET = 6:30

#### EVA DAY SUMMARY

- **Mask Prebreathe (1 hour)**
- **Depress Shuttle Crew Cabin to 10.2 psi (12 hours minimum)**

#### EVA DAY SUMMARY (continued)

- **In-suit Prebreathe (40 to 75 mins depending on the time at 10.2 psi)**
- **Crewlock Depress to vacuum (15 mins)**
- **EVA tasks (6 hours 30 mins)**
- **Airlock Repress (20 mins)**
- **Post EVA without EMU H2O Recharge or METOX Regeneration (1 hour)**
- **Pre Sleep (2 hours)**

---

*Note: Assume depress with AIRLK DEPRESS vlv; 15 min. With 2 hours of Pre-sleep, **STS Crew Day length = 14:17.**

**If the EVA is scheduled within 36 hours of 10.2 Dep, this table may be used to calculate the Final EMU PB time.**

**The less time spent at 10.2, the longer the Final EMU Prebreathe time will be; thus, resulting in an overall longer crew day length. See chart.**

***If the EVA is scheduled later than 36 hours from 10.2 Dep, the initial PB may be eliminated and the final in-suit PB is 40 mins.**
