High-Energy Astrophysics Overview

Dr. Gerald J. Fishman
NASA - Marshall Space Flight Center
&
National Space Science and Technology Center (NSSTC)
Huntsville, AL

Abstract
High-energy astrophysics is the study of objects and phenomena in space with energy densities much greater than that found in normal stars and galaxies. These include black holes, neutron stars, cosmic rays, hypernovae and gamma-ray bursts. A history and an overview of high-energy astrophysics will be presented, including a description of the objects that are observed. Observing techniques, space-borne missions in high-energy astrophysics and some recent discoveries will also be described. Several entirely new types of astronomy are being employed in high-energy astrophysics. These will be briefly described, along with some NASA missions currently under development.
High-Energy Astrophysics
- An Overview

Gamma Ray Bursts - Theories

FORMATION OF A GAMMA-RAY BURST could begin either with the merger of two neutron stars or with the collapse of a massive star. Both these events create a black hole with a disk of material around it. The hole-disk system, in turn, pumps out a jet of material at close to the speed of light. Shock waves within this material give off radiation.

Distinct subclasses of γ-ray bursts: short/hard & long/soft

![Graph showing the distribution of hard and softer spectra based on $T_{90}$ duration.](image)
Figure 4.—Hardness-ratio and duration characteristics of GRB's. When GRB's are plotted against hardness ratio and duration, two classes become evident: short/hard and long/soft.
Typical GRB Spectrum

– the Band function
BRIGGS, et al. 1999
Spectral Evolution of GRBs

(from Crider, et al. 1997)
What is the trigger?

The duration of the burst is given by the fall-back time of the gas.

The duration of the burst is determined by the viscous timescale of the accreting gas.
Collapsar Model

- Supermassive star burns off H, becomes Wolf-Rayet star with He, Fe core
- Core burned, star collapses and forms black hole with matter accretion jets
- Jets shatter outer shell of star, creates hypernova
- Jets speed on and collide with other nearby material to create the subsequent gamma-ray burst
Jet Simulation - Launched from a Collapsing Core
GRB Afterglow Decay

- The jet spreads sideways quickly
- The jet remains within initial cone
- Radiation is beamed into a narrow cone
- Jet break
- Radiation is beamed into a large cone
Gamma-ray Bursts

- Or the death of life on Earth?
