SLOW-RELEASE FERTILIZER

Inventors: Douglas W. Ming; Dadigamuwage C. Golden, both of Houston, Tex.

Assignee: The United States of America as represented by the Administrator of the National Aeronautics and Space Administration, Washington, D.C.

Patent Number: 5,433,166
Date of Patent: Jul. 18, 1995

Abstract

A synthetic apatite containing agronutrients and a method for making the apatite are disclosed. The apatite comprises crystalline calcium phosphate having agronutrients dispersed in the crystalline structure. The agronutrients can comprise potassium, magnesium, sulfur, iron, manganese, molybdenum, chlorine, boron, copper and zinc in amounts suited for plant growth. The apatite can optionally comprise a carbonate and/or silicon solubility control agent. The agronutrients are released slowly as the apatite dissolves.

SLOW-RELEASE FERTILIZER

ORIGIN OF THE INVENTION

The invention described herein was made by employee(s) of the United States Government and may be manufactured and used by or for the Government of the United States of America for governmental purposes without the payment of any royalties thereon or therefor.

This application is a continuation of application Ser. No. 07/963,348, filed Oct. 16, 1992 and now abandoned.

FIELD OF THE INVENTION

The present invention relates to a slow-release fertilizer composition having agronomic nutrient elements dispersed in a synthetic apatite.

BACKGROUND OF THE INVENTION

Agronomists and botanists have recognized the vital function of sixteen nutrients needed by growing plants including the trace elements or micronutrients—zinc, chlorine, iron, manganese, copper, molybdenum and boron. It is also known that the optimal spectrum and concentration of micronutrients in a particular soil can vary depending on the plants being grown, soil properties, climate, and the stage of the plant growth cycle.

While most soils contain micronutrients at least to some extent and the overall need is small, depletion can occur with intensive agricultural activity. Even when the soil concentration is putatively adequate, other factors can prevent micronutrient uptake by the plant. Since micronutrients must be available as soluble ions, such ions can be immobilized in low solubility alkaline soils and/or can be tapped in clays or other organic materials as insoluble complexes.

It has been common practice to supplement phosphorus-impoverished soil by using a mineral fertilizer such as rock phosphate or apatite. Such minerals, however, do not supply the required micronutrients and can contain toxic elements such as fluoride and cadmium. Other minerals can be used to supply micronutrients, however, micronutrient content can not usually be adjusted.

Required micronutrients can also be supplied directly in bulk. One disadvantage of multiple mineral and/or inorganic phases is the varying rates at which the materials dissolve and diffuse in the soil. Also, such additions give little control over micronutrient soil concentration with respect to plant needs from day to day. Another disadvantage is the relatively large quantities needed to overcome solubility and soil impediments. Bulk fertilizer can be carried off by rain or irrigation water or leached from the soil as a ground water pollutant. Thus, bulk use is inefficient and costly.

In space travel, agronomical species such as wheat, potatoes, soybeans, and the like in hydroponic tanks can fixate carbon dioxide into edible biomass. Hydroponic systems, however, require soluble nutrients to be continuously supplied and closely monitored. Hence, solid support substrates may provide a low maintenance, high reliability substrate for plant growth. It is, therefore, very desirable that the fertilizer is strictly tailored to the requirements of the on-board cultures. In addition, the fertilizer should be compact, long-lasting and contain all required micronutrients, which are released as needed over a long period time, encompassing several growing seasons, without replenishment.

It is consequently desirable to tailor a synthetic phosphate fertilizer composition to specific agronomic needs in both terrestrial and space environments. It is also desirable that the composition have only the desired spectrum of micronutrient elements which can be released in a controlled manner and be free of toxic elements which are normally present in natural phosphate fertilizers.

U.S. Pat. No. 3,958,973 to Roberts describes a micronutrient metal containing phosphate glass for fertilizer use. The glass is based on P2O5 and the micronutrients are based on the metal oxide. A solubility control agent is said to be present to control the amount and rate of release.

U.S. Pat. No. 4,299,613 to Carderelli describes a polymeric composition incorporating essential plant growth compounds in ionic form. These compounds are said to be gradually, continuously and uniformly released over a long period of time in response to the presence of moisture.

U.S. Pat. No. 4,334,906 to Young describes a combination soil amendment and micronutrient source. The composition comprises highly porous sulfur particles having substantial internal surface area with the micronutrient source dispersed either throughout the particle matrix or over the interior surfaces.

U.S. Pat. No. 4,670,039 to Sjogren describes a controlled slow release fertilizer composition comprising an encapsulated fertilizer, carbon particles and plaster.

U.S. Pat. No. 4,994,100 to Sutton et al. describes a granular nitrogen fertilizer made up of urea, dicyandiamide, ammonium thiourea, and optionally a phosphate compound. This composition can contain various micronutrients.

U.S. Patent 4,557,749 to Berthet et al. describes a sealed container for a hydrosoluble fertilizer or agricultural product. The container has a wall made of a hydrophobic polymer diaphragm with hydrophilic inclusions which absorb water. Water passing into the container dissolves the fertilizer which is then desorbed into the medium being treated.

Other U.S. Patents of interest include U.S. Pat. Nos. 4,507,139 to Sullivan et al.; 4,175,943 to Jordaan et al.; and 4,995,897 to Schramm et al.

SUMMARY OF THE INVENTION

The present invention is a synthetic apatite phosphate fertilizer composition containing essential micronutrients as well as other essential nutrients such as magnesium, potassium and sulfur, and a method for making the composition. In addition, the synthetic apatite is essentially free of toxic elements. Furthermore, a solubility control agent can be added to enhance control of the nutrient release rate.

In one embodiment, the present invention provides for a synthetic apatite useful as a slow-release fertilizer. The apatite has a matrix of calcium phosphate and one or more agronomists dispersed in the matrix. The apatite is preferably essentially free of agrotoxins, such as, for example, fluoride, cadmium and sodium, in amounts detrimental to the growth of most plants. Agronomists include, for example, potassium, magnesium, sulfur, zinc, chlorine, iron, manganese, copper, molybdenum and/or boron. The synthetic apatite can further include a carbonate and/or silicon solubility control agent. The matrix preferably comprises a synthetic apatite.
In a preferred embodiment, the present invention provides an agronutrient-substituted hydroxyapatite of the formula:

$$[Ca_{5+\alpha}Mg_{4-\alpha}Fe_{9-a}Zn_{d}Mn_{c}\text{Cu}_{e}O_{40}(OH)_{2}]SO_{4}(aq)$$

wherein $m$ is the molar average valence of the potassium, magnesium, iron, zinc, manganese and copper cations according to the equation:

$$y=S=(y_{C}+y_{Si}+y_{Mo}+y_{B}+y_{S})/y$$

$$m=(x_{K}+2x_{Mg}+2x_{Fe}+2x_{Zn}+2x_{Mn}+x_{Cu})/x$$

wherein $y_{C}$ is the valence of $C$; wherein $x_{K}$ is the valence of potassium, $x_{N}$ is the valence of nitrogen, $x_{Mg}$ is the valence of magnesium, $x_{Fe}$ is the valence of iron, $x_{Zn}$ is the valence of zinc, and $x_{Cu}$ is the valence of copper. Preferably $M_{K}$ has the formula:

$$K_{d}M_{s}Z_{e}O_{45}$$

wherein $x_{K}$ has a value up to about 0.205; $x_{Mg}$ has a value up to about 0.412; $x_{Fe}$ has a value up to about 0.144; $x_{Zn}$ has a value up to about 0.0123; $x_{Cu}$ has a value up to about 0.0038; $x_{K}=x_{N}+x_{Mg}+x_{Fe}+x_{Zn}+x_{Cu}$; and wherein $x>0$. More preferably, $0.051 \leq x_{K} \leq 0.205$; $0.165 \leq x_{Mg} \leq 0.412$; $0.052 \leq x_{Fe} \leq 0.144$; $0.019 \leq x_{Zn} \leq 0.0123$; $0.018 \leq x_{Cu} \leq 0.0038$; and $0.005 \leq x_{C} \leq 0.0038$. Especially, $0.102 \leq x_{K} \leq 0.205$; $0.144 \leq x_{Mg} \leq 0.412$; $0.106 \leq x_{Fe} \leq 0.144$; $0.018 \leq x_{Zn} \leq 0.0123$; and $0.005 \leq x_{Cu} \leq 0.0038$. Where carbonates are used as the solubility control agent, preferably $0.002 \leq y_{C} \leq 0.00042$; $0.00185 \leq y_{B} \leq 0.00741$; and $0.125 \leq y_{S} \leq 0.205$. Especially, $0.102 \leq x_{K} \leq 0.154$; $0.247 \leq x_{Mg} \leq 0.33$; $0.072 \leq x_{Fe} \leq 0.108$; $0.0061 \leq x_{Zn} \leq 0.0092$; $0.018 \leq x_{Cu} \leq 0.036$; and $0.0025 \leq x_{C} \leq 0.0032$. Where fluoride is used as the solubility control agent, preferably $0.002 \leq y_{C} \leq 0.000042$; $0.00185 \leq y_{F} \leq 0.00741$; and $0.125 \leq y_{S} \leq 0.205$. Especially, $0.072 \leq x_{Fe} \leq 0.108$; $0.002 \leq x_{Mg} \leq 0.0089$; $0.018 \leq x_{Cu} \leq 0.036$; $0.0025 \leq x_{C} \leq 0.0032$; $0.00021 \leq y_{Mo} \leq 0.0000313$; $0.0037 \leq y_{B} \leq 0.0056$; and $0.156 \leq y_{S} \leq 0.219$. Where silicates are used as the solubility control agent, preferably $0.002 \leq y_{C} \leq 0.000313$; $0.0037 \leq y_{S} \leq 0.0056$; and $0.156 \leq y_{S} \leq 0.219$. Where hydroxylapatite is precipitated which has agronutrients dispersed in a matrix, in other steps the precipitate is recovered and dried.
Essential agronomic nutrients for plant growth including potassium, magnesium, sulfur and micronutrients are incorporated into a matrix of a synthetic apatite. Upon contact by moisture, the nutrients are slowly released, as required, for plant use. In addition, a solubility control agent can be added to enhance control over the fertilization rate.

The major component of the synthetic apatite composition is a calcium phosphate which is at least slightly soluble in water. Water solubility is necessary to give mobility to nutrient elements contained in the apatite matrix.

Preferably, from about 30 to about 50 parts phosphorus are used per 100 parts calcium, by weight, and more preferably, from about 40 to about 45 parts phosphorus per 100 parts calcium.

One or more essential agronomic nutrients besides calcium and phosphorus are dispersed within the crystal structure of the synthetic apatite. Essential agronomic nutrients (agronutrients) in addition to calcium and phosphorus, include potassium, nitrogen, magnesium, sulfur, zinc, chlorine, iron, manganese, copper, molybdenum and boron. The latter seven elements (zinc, chlorine, iron, manganese, copper, molybdenum and boron) are generally referred to as micronutrients and are needed by plants in lower amounts than the other essential agronomic nutrients.

Agronutrients are provided in the present composition as water soluble inorganic (ionic) compounds. The inorganic compounds should not have acute toxicity (e.g. cyanide salts), or other undesirable properties and should be free of excessive amounts of agrotoxins including unwanted elements and organic toxins. Undesirable elements typically include most heavy metals such as lead, cadmium, mercury, and the like, and other elements such as fluorine, sodium, arsenic, antimony, selenium, tin, and the like. The synthetic apatite can, however, contain a relatively small amount of any of these toxins below a toxic level for plants and, where appropriate, grazing animals. For example, natural apatite contains about 6 percent fluorine and has only limited potential as a soil supplement because of the fluorine toxicity, particularly to grazing animals such as sheep which can ingest the fluorine, e.g. by licking the soil containing the supplement. Prior art phosphatic fertilizers, in contrast, can contain about 3000 ppm fluo-

The synthetic apatite composition can also comprise a silicon and/or carbonate solubility control agent dispersed in the apatite matrix. The solubility control agent increases or decreases the water solubility and permits enhanced control over the rate at which nutrient elements are released.

The solubility control agent is provided in the synthetic apatite composition as a water soluble inorganic or organic compound. Examples of suitable water soluble carbonate compounds include sodium carbonate, sodium bicarbonate, ammonium carbonate, ammonium bicarbonate, potassium carbonate and potassium bicarbonate. Examples of water soluble silicon compounds include inorganic silicates such as sodium silicate, sodium disilicate, sodium metasilicate, sodium orthosilicate, potassium disilicate, potassium metasilicate, potassium hydrogen disilicate, ammonium silicate, and hydrates thereof, and organic silicates such as ethyl orthosilicate and propyl orthosilicate.

A solubility control agent can comprise from 0 to about 15 parts by weight per 100 parts calcium. A carbonate agent is preferably used in an amount of 0 to about 15 parts by weight per 100 parts calcium, more preferably from about 2 to about 10 parts by weight and optimally from about 4 to about 6 parts by weight. A silicon agent is preferably used in an amount of 0 to

The synthetic apatite composition may contain one or more carbonate control agents or silicon control agents, or both.
about 10 parts by weight per 100 parts calcium, more preferably from about 2 to about 6 parts by weight and optimally from about 3 to about 5 parts by weight.

The present synthetic apatite composition can optionally include a binder agent to facilitate processing of the calcium phosphate into pellet form. Examples of such processing aid binders include calcium-lignosulfonate, cellulose, and the like. The binder comprises from 0 to about 10 percent by weight or more of the synthetic apatite matrix.

The present synthetic apatite composition is the precipitated product of a water soluble calcium compound and a water soluble phosphate mixture comprising a water soluble phosphate compound and one or more water soluble agronutrients. The resulting product has nutrient elements incorporated into the structure of the calcium phosphate matrix.

The apatite is conveniently made, for example, by preparing two or more aqueous stock solutions containing the appropriate compounds and mixing the stock solutions together. An inorganic replacement reaction occurs in the solution mixture to produce a precipitate. The precipitate can be recovered, e.g., by filtration, and dried.

A first stock solution is made by dissolving a suitable quantity of the water soluble calcium compound in a neutral or basic aqueous medium. Examples of suitable calcium compounds include calcium nitrate, calcium nitrite, calcium chloride, calcium chlorate, hydrates thereof, and the like. Calcium nitrate tetrahydrate is a preferred compound. The first stock solution preferably includes the calcium compound in an amount of from about 1.0 to about 1.6 moles per liter.

A second stock solution is prepared by dissolving a suitable quantity of the soluble phosphate compound and suitable quantities of the soluble anionic nutrient compound(s) in a neutral or basic aqueous medium. Examples of suitable soluble phosphate compounds include ammonium orthophosphate-mono, ammonium orthophosphate, ammonium hypophosphate and the like. The second solution preferably includes the phosphate compound in an amount of from about 0.5 to about 0.8 moles per liter. The amount of anionic nutrient compound(s) in the second solution will depend on the desired concentration in the synthetic apatite end product which, in turn, will depend on the agronomic application. Generally, the second stock solution can include one or more anionic nutrient compounds each in an amount of from about 0.002 to about 0.4 moles per liter.

A third stock solution is prepared, where appropriate, by dissolving a suitable quantity of the soluble cationic nutrient compound(s) in a neutral or basic aqueous medium. The quantity of the cationic nutrient compound(s) in the third solution will again depend on the desired concentration in the synthetic apatite end product which, in turn, will depend on the agronomic application. Generally, the third solution includes one or more cationic nutrient compounds, each in an amount of from about 0.05 to about 5 moles per liter.

The optional silicon and/or carbonate solubility control agent can be added to the second (anionic) stock solution in an amount of from about 0.002 to about 0.4 moles per liter.

When preparing the above stock solutions, it is desirable to avoid mixing salts together which can undergo unwanted inorganic replacement reactions in the stock solutions. Therefore, ionic compounds having a desired component element in the anion are held in solution separately from ionic compounds having a desired component element in the cation. Liquid organic compounds (e.g., ethyl orthosilicate), however, can be added to any of the stock solutions or added separately before or after the stock solutions are mixed together.

A preferred basic aqueous medium comprises a solution of from about 18 to about 30 percent by weight of ammonium hydroxide in deionized water. A preferred neutral aqueous medium comprises deionized water.

Typically, the third stock solution is mixed with the second stock solution and the combined solution is then mixed with the first stock solution. The resulting mixture is then maintained at ordinary temperature and pressure for a sufficient time period for the crystalline precipitate to form.

The precipitate is recovered by ordinary means, such as, for example, by decanting the supernatant and filtering in a Buchner funnel. The precipitate is preferably washed with deionized water.

The washed precipitate can be dried at room temperature. Preferably, however, the precipitate is dried at a temperature ranging from about 200°C. to about 600°C. for a time period of from about 2 to about 20 hours in drying equipment such as an oven, wherein the temperature is preferably boosted in steps of 200°C. after 2 hour intervals. The drying procedure can simultaneously dry the precipitate and dehydrate or partially dehydrate the calcium phosphate end product. Solubility is also partially dependent on the degree of hydration of the calcium phosphate crystals, i.e., crystal size and degree of crystallinity. Since solubility is reduced by dehydration, the drying procedure should be used to adjust the solubility of the final product. The actual drying procedure used is not particularly critical so long as care is exercised in obtaining the desired degree of dehydration. The dried precipitate is preferably cooled in a low humidity environment.

The precipitate can be crushed, granulated or pelletized by conventional means to produce a suitable particle size for use in soil treatment. Binding agents can be used to assist the formation of a relatively consistent granulation particle size and avoid the production of fines. Preferably, non-reactive binders are used.

As indicated above, the type of nutrient elements incorporated into the calcium phosphate crystal structure can vary from a single nutrient element to all seven micronutrients as well as potassium, sulfur and magnesium. The quantity of each nutrient element incorporated can be specified based on the agronomic factors involved.

When the instant synthetic apatites come in contact with moisture, the dispersed nutrients (in addition to the calcium and phosphorus) are slowly released as dissolution occurs. However, several factors affect the degree of solubility and hence can be used to control the rate of nutrient release. Mentioned above are the solubility control agents and the drying treatment. Other known factors include soil acidity, size of the apatite crystals, and the presence of calcium or phosphate sinks in the system, e.g., an exchange material. Desired solubility is usually determined empirically based on soil properties, climate, rainfall, type of plant being grown, growth cycle requirements, and the like agronomic factors. The effect of carbonate content on natural apatites is described in several publications including Caro, J., *Journal of Agricultural Food Chemistry*, 46:68-687, 1956; McClellan, G., *American Mineralogist*, 54:1374-1391.
Three synthetic apatite compositions having nutrient elements incorporated into the crystalline structure were synthesized by an inorganic replacement reaction to simulate a naturally occurring hydroxyapatite mineral. Initially, three stock solutions (A, B and C) were prepared using laboratory reagent grade chemicals. Each reaction was run using 500 ml of stock solutions A and B and 20 ml of stock solution C. The composition of the solutions is shown in Table 2.

After stock solutions A, B and C were prepared, solution C was quickly added to solution B and vigorously mixed for several seconds. This combined solution (B and C) was then added to solution A. In Example 2, the ethyl orthosilicate liquid was also added to solution A concurrently with solutions B and C. In all the examples the final mixture was vigorously stirred for 5 minutes and then allowed to stand for 18 hours to precipitate the calcium phosphate product. The clear supernatant was decanted and disposed of. The precipitate was washed 4 times with 3 liters of deionized water. The precipitate was filtered using a Büchner funnel and Whatman no. 41 filter paper, and washed again with an additional 500 ml of deionized water. The precipitate was dried in an oven at 200° C. for 17 hours, lightly crushed in an agate mortar and stored in a desiccator.

The three synthetic materials were characterized by powder x-ray diffraction and by electron microprobe analysis. The Figure shows diffractographs of the compositions. The peaks (d-spacing) correspond to peaks for natural hydroxyapatites. Peak width was narrow suggesting that individual crystals have a width of from about 200-500 angstroms. The chemical analysis of the composition is shown in Table 3.

Examples 4-12

In the following examples, the apatite compositions prepared in Examples 1-3 were contacted with deionized water to determine the equilibrium ion concentrations after dissolution. At the end of each run, pH and the ion concentrations of the various elements were measured. Concentrations of manganese, iron, copper and zinc ions were determined using DTPA chelating agent (pH = 7.3). The procedure consisted of placing a 0.5 g sample of the synthetic apatite composition in a covered glass bottle containing 80 ml of deionized water. The bottles and samples were placed in an environmentally controlled reciprocal shaker at a setting of 100 rpm and shaken for 96 hours. The temperature was held at 25° C. Results are given in Table 4.

Examples 13-39

In the following examples, the apatite compositions prepared in Examples 1-3 were contacted with an aqueous medium wherein the pH was varied between 5 and 7 to determine the equilibrium calcium and magnesium concentration as an indication of solubility versus pH. The procedure was similar to Examples 4-12 except that 0.5M sodium acetate solutions buffered with acetic acid to the desired pH were used instead of deionized water. Results are given in Table 5. As expected, the synthetic apatite dissolved to a greater extent in a more acidic medium.

DTPA extractable, pH = 7.3.

The foregoing description of the composition and method is illustrative and explanatory thereof. Various changes in the materials, apparatus, and particular components and steps employed will occur to those skilled in the art. It is intended that all such variations within the scope and spirit of the appended claims be embraced thereby.

What is claimed is:

1. A method for preparing a slow-release synthetic apatite fertilizer, comprising the steps of:

   (1) preparing an aqueous calcium solution from a soluble ionic calcium compound;

   (2) preparing an aqueous phosphate solution from a soluble ionic phosphate compound, optionally with an anionic agronutrient selected from sulfate, chloride, molybdate, borate, and combinations thereof, from a soluble ionic compound containing the anionic agronutrient;

   (3) optionally preparing an aqueous solution of cationic agronutrients selected from potassium, magnesium, zinc, iron, manganese, copper, and combinations thereof, from a soluble ionic compound containing the cationic agronutrient;

   (4) mixing together the calcium solution, the phosphate solution and the cationic agronutrient solution, if prepared, and forming an apatite precipitate by inorganic replacement reaction; and

   (5) recovering the precipitate with a crystalline hydroxyapatite structure having at least one agronutrient structurally dispersed therein selected from sulfate, borate, molybdate, potassium, magnesium, zinc, iron, manganese, copper, or a combination thereof.

2. The method of claim 1, wherein the cationic agronutrient solution is prepared, and wherein the mixing step comprises sequentially mixing the phosphate solution with the cationic agronutrient solution and then mixing the resulting phosphate-agronutrient solution with the calcium solution.

3. The method of claim 1, wherein the cationic agronutrient solution is prepared, the calcium solution comprises from about 1.0 to about 1.6 moles per liter calcium, the phosphate solution comprises from about 0.5 to about 0.8 moles per liter phosphate and from about 0.002 to about 0.4 moles per liter of sulfate, molybdate, borate, or a combination thereof, and the cationic agronutrient solution comprises from about 0.05 to about 5 moles per liter of potassium, magnesium, zinc, iron, manganese, copper, or a combination thereof.

4. The method of claim 1, wherein the cationic agronutrient solution is prepared, the calcium solution comprises 1.0-1.6 molar calcium, the phosphate solution comprises 0.5-0.8 molar phosphate and 0.002-0.4 molar sulfate, molybdate, chloride and borate, and the cationic agronutrient solution comprises 0.05-5 molar potassium, magnesium, zinc, iron, manganese and copper.

5. The method of claim 1, wherein the mixing step comprises mixing the solutions together with a solution of at least one water soluble solubility control agent selected from silicon and carbonate compounds.

6. The method of claim 5, wherein the carbonate compound is selected from sodium carbonate, sodium bicarbonate, ammonium carbonate, ammonium bicarbonate, potassium carbonate and potassium bicarbonate; or the silicon compound is selected from sodium silicate, sodium disilicate, sodium metasilicate, sodium orthosilicate, potassium disilicate, potassium metasilicate, potassium hydrogen disilicate, ammonium silicate, hydrates thereof and ethyl orthosilicate.

7. A slow-release fertilizer, comprising:

   one or more agronutrients structurally dispersed in a crystalline matrix of hydroxyapatite essentially free of agrotoxins and prepared by the method of claim 1.

8. The fertilizer of claim 7, comprising from about 30 to about 50 parts phosphorus per 100 parts calcium by weight; potassium up to about 4 parts per 100 parts calcium.
calcium by weight; magnesium up to about 5 parts per 100 parts calcium by weight; sulfur up to about 4 parts per 100 parts calcium by weight; zine up to about 0.4 parts per 100 parts calcium by weight; chlorine up to about 1.25 parts per 100 parts calcium by weight; iron up to about 4 parts per 100 parts calcium by weight; manganese up to about 1.2 parts per 100 parts calcium by weight; copper up to about 0.12 parts per 100 parts calcium by weight; molybdenum up to about 0.0025 parts per 100 parts calcium by weight; and boron up to about 0.05 parts per 100 parts calcium by weight.

9. The fertilizer of claim 8, comprising not more than 3000 ppm fluorine.
10. The fertilizer of claim 7, further comprising a silicon and/or carbonate solubility control agent.
11. The fertilizer of claim 10, comprising from about 2 to about 10 parts silicon per 100 parts calcium.
12. The fertilizer of claim 10, comprising from about 2 to about 15 parts carbonate agent per 100 parts calcium.
13. The fertilizer of claim 7, comprising not more than 10 parts calcium by weight.
14. The fertilizer of claim 1, comprising not more than 10 parts calcium by weight; magnesium up to about 45 parts per 100 parts calcium by weight; 1-4 parts potassium; 2-5 parts magnesium; 2-4 parts sulfur; 0.2-0.4 parts zinc; 0.5-1.25 parts chlorine; 1-4 parts iron; 0.5-1.2 parts manganese; 0.05-0.12 parts copper; 0.001-0.002 parts molybdenum; and 0.01-0.04 parts boron.
15. The fertilizer of claim 7, comprising not more than 10 parts calcium by weight; magnesium up to about 45 parts per 100 parts calcium by weight; 1-4 parts potassium; 2-5 parts magnesium; 2-4 parts sulfur; 0.2-0.4 parts zinc; 0.5-1.25 parts chlorine; 1-4 parts iron; 0.5-1.2 parts manganese; 0.05-0.12 parts copper; 0.001-0.002 parts molybdenum; and 0.01-0.04 parts boron.

16. The method of claim 11, comprising dehydrating the precipitate at a temperature from about 200°C to about 600°C to control the solubility of the synthetic apatite.
17. An agronutrient-substituted hydroxyapatite of generally uniform composition having the formula:

(Ca5-xmMx(PO4)3y(SO4)x(OH)y)1-xS

wherein M is a cation containing an element selected from potassium, zinc, iron, manganese, magnesium, 60 or copper, or a combination thereof;
wherein m is the molar average valence of M according to the equation m = (ΣxiMi)/(Σxi) where each Mi is the valence of an ith cation comprising M and xi is the relative molar proportion of the ith cation;
wherein Q is an anion of carbonate, silicate or containing an element selected from boron, molybdenum, or sulfur, or a combination thereof;
wherein q is the molar average valence of Q according to the equation q = (ΣyiQy)/Σyi where each qi is the valence of an ith anion comprising Q and yi is the relative molar proportion of the ith anion;
wherein X is chloride, fluoride or a combination thereof;
and
wherein x has a value of 0-0.82, y has a value of 0-0.76, and z has a value of 0-1.5, provided that at least one of x and y are greater than zero and the amount of fluoride does not exceed 3000 ppm by weight, and when x is zero Q includes an anion of boron, molybdenum, or sulfur, or a combination thereof.
18. A method for supplying nutrient elements in an agronomical process, comprising the steps of:
placing a fertilizing amount of the hydroxyapatite composition of claim 17 adjacent a plant root system; and
contacting the hydroxyapatite with moisture to release the agronutrient.
19. A hydroponics fertilizing method comprising the steps of:
circulating a hydroponics solution through a bed of the hydroxyapatite composition of claim 17 to replenish the concentration of agronutrients in the hydroponics solution.
20. The hydroxyapatite of claim 17, wherein M has the formula:

K2(Mg,gA12Zn,2Mn,2Cu)25

wherein:

xK ≤ 0.205;
xMg ≤ 0.412;
xA1 ≥ 0.144;
xZn ≤ 0.0123;
xMn ≤ 0.044;
xCu ≤ 0.0038;
x ≥ 0.0016;
x ≥ 0.00185;
x ≥ 0.00741; and
x > Q.
21. The hydroxyapatite of claim 20, wherein:

0.051 ≤ xK ≤ 0.205;
0.165 ≤ xMg ≤ 0.412;
0.0359 ≤ xA1 ≤ 0.144;
0.006 ≤ xZn ≤ 0.0123;
0.016 ≤ xMn ≤ 0.044; and
0.0016 ≤ xCu ≤ 0.0038.
22. The hydroxyapatite of claim 20, wherein:

0.102 ≤ xK ≤ 0.154;
0.247 ≤ xMg ≤ 0.33;
0.072 ≤ xA1 ≤ 0.108;
0.0061 ≤ xZn ≤ 0.0092;
0.018 ≤ xMn ≤ 0.036; and
0.0025 ≤ xCu ≤ 0.0032.
23. The hydroxyapatite of claim 17, wherein Q has the formula:

(CO3)3(2SiO4)3(MnO2)3(BO3)3g(SO4)3

wherein yC has a value up to about 0.5, yS has a value up to about 0.218, yM has a value up to about 0.000052, yZn has a value up to about 0.0093, and yS has a value up to about 0.25; and

y = yC + yS + yM + yZn + y + yS and (yM + yZn + yS) > 0.
24. The hydroxyapatite of claim 23, wherein:

0.00002 ≤ yM ≤ 0.000042;
0.00185 ≤ yZn ≤ 0.00741; and
5,433,766

25. The hydroxyapatite of claim 24, wherein:

\[ 0.0668 \leq y_c \leq 0.334 \] or
\[ 0.0435 \leq y_n \leq 0.109. \]

26. The hydroxyapatite of claim 23, wherein:

\[ 0.00021 \leq y_{Me} \leq 0.0000313; \]
\[ 0.0037 \leq y_M \leq 0.0056; \] and
\[ 0.156 \leq y_{SO_4} \leq 0.219. \]

27. The hydroxyapatite of claim 26, wherein:

\[ 0.134 \leq y_c \leq 0.2; \] or
\[ 0.065 \leq y_n \leq 0.109. \]

28. The hydroxyapatite of claim 17, wherein \( x_z \) has the formula:

\[ \text{Ch}_{12}F \]

wherein \( z_{Cl^+} \) has a value up to about 0.071, \( z_F^+ \) has a value less than about 0.08, and \( z = z_{Cl^+} + z_F^+ \).

29. The hydroxyapatite of claim 28, wherein:

\[ 0.0283 \leq z_{Cl^+} \leq 0.071; \] and
\[ z_F^+ \leq 0.008. \]

30. The hydroxyapatite of claim 28, wherein:

\[ 0.0565 \leq z_{Cl^+} \leq 0.064; \] and
\[ z_F^+ \leq 0.00008. \]

31. An agronutrient-substituted hydroxyapatite of the formula:

\[ [\text{Ca}_{3-x}M_x\text{K}_y\text{Mo}_{3-x}y\text{Fe}_{y}z_{Fe}\text{Zn}_{z_{Fe}}\text{Mn}_{z_{Mn}}\text{Cu}_{z_{Cu}}\text{Ca}_{z_{Ca}}](-\text{PO}_4)_{3-x}y\text{(CO}_3)_{y}(\text{SiO}_4)_{z_{Si}}(\text{MoO}_4)_{z_{Mo}}(\text{BO}_3)_{z_{BO}}\beta(\text{SO}_4)_{\beta}((\text{OH})_{\delta})_{\delta},\text{Ch}_{12}F \]

wherein \( m \) is the molar average valence of the potassium, magnesium, iron, zinc, manganese and copper cations according to the equation:

\[ m = (x_K+2x_{Mg}+3x_{Fe}+2x_{Zn}+x_{Mn}+x_{Cu})/x \]

wherein \( Q_5 \) is an anion of sulfur and \( q \) is the molar average valence of the anions \( \text{CO}_3, \text{SO}_4, \text{SiO}_4, \text{BO}_3 \) and \( \text{SO}_4 \) according to the equation:

\[ q = (2y_{C}+3y_{Mg}+3y_{Fe}+2y_{Zn}+y_{Mn}+y_{Cu}+y_{SO_4})/y \]

wherein \( x = x_K+x_{Mg}+x_{Fe}+x_{Zn}+x_{Mn}+x_{Cu}, y = y_C + y_{SO_4}+y_{Mg}+y_{Fe}+y_{Zn}, z = z_{Cl^+}+z_F^+ \), and at least one of \( x, y_{Mg}, y_F \) and \( y_{SO_4} \) is greater than zero; and \( x_c \) equals:

\[ 0.21; \]
\[ 0.41; \]
\[ 0.14; \]
\[ 0.012; \]
\[ 0.044; \]
\[ 0.032; \]
\[ 0.00038; \]
\[ 0.005; \]
\[ 0.218; \]
\[ 0.000052; \]
\[ 0.00093; \]
\[ 0.025; \]
\[ 0.071; \] and
\[ z_f^+ \leq 0.08. \]

32. The hydroxyapatite of claim 31, wherein:

\[ 0.051 \leq x_K \leq 0.205; \]
\[ 0.165 \leq x_{Mg} \leq 0.412; \]
\[ 0.0359 \leq x_{Fe} \leq 0.144; \]

0.0065 \leq x_{Zn} \leq 0.0123; 
0.0065 \leq x_{Mn} \leq 0.044; 
0.0016 \leq x_{Cu} \leq 0.0038; 
0.00002 \leq y_{Mg} \leq 0.000042; 
0.00185 \leq y_{Fe} \leq 0.00741; 
0.125 \leq y_{Mn} \leq 0.25; 
0.0283 \leq y_{Cl^+} \leq 0.071; \] and
\[ z_f^+ \leq 0.008. \]

33. The hydroxyapatite of claim 32, wherein:

\[ 0.134 \leq y_c \leq 0.334; \] or
\[ 0.0435 \leq y_M \leq 0.131. \]

34. The hydroxyapatite of claim 31, wherein:

\[ 0.102 \leq x_K \leq 0.154; \]
\[ 0.247 \leq x_{Mg} \leq 0.33; \]
\[ 0.072 \leq x_{Fe} \leq 0.108; \]
\[ 0.006 \leq x_{Zn} \leq 0.0099; \]
\[ 0.018 \leq x_{Mn} \leq 0.036; \]
\[ 0.0025 \leq x_{Cu} \leq 0.0032; \]
\[ 0.000021 \leq y_{Mg} \leq 0.0000313; \]
\[ 0.0037 \leq y_{SO_4} \leq 0.0056; \]
\[ 0.157 \leq y_{Zn} \leq 0.219; \]
\[ 0.0565 \leq z_{Cl^+} \leq 0.064; \] and
\[ z_F^+ \leq 0.00008. \]

35. The hydroxyapatite of claim 34, wherein:

\[ 0.134 \leq y_c \leq 0.2; \] or
\[ 0.0653 \leq y_M \leq 0.109. \]

36. The method of claim 1, wherein the calcium compound comprises calcium nitrate, calcium nitrite, calcium chloride, calcium hydroxide or a hydrate thereof and the phosphate compound comprises ammonium orthophosphate-monohydrate, ammonium orthophosphate-di, ammonium orthophosphate or ammonium hypophosphate.

37. The method of claim 1, wherein the potassium compound is selected from potassium chloride, potassium nitrate, potassium nitrite, potassium sulphate, potassium phosphate; the magnesium compound is selected from magnesium nitrate, magnesium chloride, magnesium sulphate, magnesium perchlorate and rotates thereof; the sulfur compound is selected from sodium sulfate, ammonium sulfate, potassium sulfate, and rotates thereof; the zinc compound is selected from zinc chloride, zinc nitrate, zinc nitrite, zinc sulfate and rotates thereof; the chlorine compound is selected from sodium chloride, potassium chloride, ammonium chloride; the iron compound is selected from ferric nitrate, ferrous nitrate, ferrous nitrite, ferric nitrite, ferric chloride, ferrous chloride, ferric sulfate, ferrous sulfate and rotates thereof; the manganese compound is selected from manganese (II) nitrite, manganese (II) nitrite, manganese dichloride, manganese (II) sulfate and rotates thereof; the copper compound is selected from copper (II) chloride, copper (III) chloride, copper (II) nitrate, copper (II) nitrite and rotates thereof; the molybdenum compound is selected from ammonium paramolybdate, ammonium permolybdate, sodium trimolybdate, sodium tetramolybdate, sodium paramolybdate, sodium octamolybdate, potassium molybdate, ammonium tetraborate, potassium molybdate, ammonium tetraborate, hydrates thereof and orthoboric acid.
