An article includes a silicon-containing substrate and a modified mullite coating. The modified mullite coating comprises mullite and a modifier component that reduces cracks in the modified mullite coating. The article can further comprise a thermal barrier coating applied to the modified mullite coating. The modified mullite coating functions as a bond coating between the external environmental/thermal barrier coating and the silicon-containing substrate. In a method of forming an article, a silicon-containing substrate is formed and a modified mullite coating is applied. The modified mullite coating comprises mullite and a modifier component that reduces cracks in the modified mullite coating.

COATED ARTICLE AND METHOD OF MAKING

This patent application claims the benefit under 35 U.S.C. §119(e) of provisional patent application having serial No. 60/083,158; filed on Apr. 27, 1998.

This invention was made with government support under Contract No. NASA-26385 awarded by NASA. The government may have certain rights in the invention.

BACKGROUND OF THE INVENTION

The invention relates to an article having at least a modified mullite coating. The invention further relates to a silicon-containing substrate having at least a modified mullite coating. The invention further relates to a silicon-containing ceramic substrate having a modified mullite coating and at least one additional layer of material.

Silicon-containing materials have been proposed for structures used in high temperature applications, such as in heat exchangers and advanced internal combustion engines. For example, silicon-based composite ceramics have been proposed as materials for applications in combustors for commercial airplanes. However, these ceramic materials exhibit poor oxidation resistance in reducing atmospheres and in environments containing salts, water vapor or hydrogen. Hence, it is necessary to apply environmental barrier coatings to the silicon-containing materials to provide protection from environmental attack at elevated temperatures and to apply thermal barrier coatings to extend the life at elevated temperatures.

Mullite has been proposed as a material for environmental barrier coatings as well as thermal barrier coatings on silicon-containing materials. Mullite exhibits low thermal conductivity. It has low density and a high melting point. However, mullite coatings tend to develop cracks perpendicular to substrates and through the thickness of the coating. These cracks are detrimental to the functions of the mullite coating because they serve as transport paths for corrosive species causing severe oxidation and corrosion at the interface between the coating and substrate. Additionally, cracks in the coating concentrate stresses. The cracks apply shear and tensile forces on the substrate to cause substrate fractures.

Since the crack openings increase with increasing distance from the mullite substrate interface, the cracks may be the result of the difference in thermal expansion between the mullite coating and the silicon-containing substrate. FIG. 1 shows differences in the coefficient of thermal expansion (CTE) of mullite, silicon carbide (SiC) and silicon (Si). Thus, there is a need to provide coatings or layer to silicon-containing substrates that act at least as environmental barrier coatings having reduced cracks.

SUMMARY OF THE INVENTION

The present invention is based on the discovery that a modifier component can be added to a mullite coating to reduce cracks in the coating applied to a silicon-containing substrate. The mullite coating with the modifier component is also referred to as a modified mullite coating. The modified mullite coating reduces fracture at the interface of the mullite coating and the silicon-containing substrate.

In one aspect, the invention relates to an article comprising a silicon-containing substrate and a modified mullite coating. The modified mullite coating comprises mullite and a modifier component that reduces cracks, including through-thickness cracks, in the mullite coating. Preferably, the modifier component comprises a component having a lower thermal expansion than the mullite coating. As a result, the modifier component imparts a lower thermal expansion coefficient to the mullite coating. The article can further comprise an external environmental/thermal barrier coating applied to the modified mullite coating. The modified mullite coating then functions as a bond coat between the external environmental/thermal barrier coating and the silicon-containing substrate.

In another aspect, the invention relates to a method of forming an article with at least a modified mullite coating. In the method, a silicon-containing substrate is formed and a modified mullite coating is applied. The modified mullite coating comprises mullite and a modifier component that reduces cracks in the coating.

BRIEF DESCRIPTION OF THE DRAWINGS

FIG. 1 is a graph illustrating comparative coefficient of thermal expansions for mullite, silicon carbide and silicon.

FIG. 2 is a graph illustrating comparative coefficient of thermal expansions for mullite, cordierite, fused silica and celsian (BaO.4Al₂O₃.2SiO₂).

FIG. 3 is a photomicrograph for a mullite with yttria stabilized zirconia-coated silicon carbide/silicon carbide composite.

FIG. 4 is a photomicrograph for a mullite with twenty-two volume percent calcium aluminosilicate and a yttria stabilized zirconia-coated silicon carbide/silicon carbide composite; and

FIG. 5 is a photomicrograph for a mullite with eighteen volume percent barium strontium aluminosilicate and a yttria stabilized zirconia-coated silicon carbide/silicon carbide composite.

DETAILED DESCRIPTION OF THE INVENTION

According to the invention, a modifier component is added to a mullite coating to reduce or eliminate cracks, including through-thickness cracks. By through thickness cracks are meant cracks that extend through the entire thickness of the mullite coating from near the top surface to near the bottom of the coating or near the silicon-containing substrate. The modifier components can be categorized into one or more of at least three functional groups. (1) The modifier component imparts a lower coefficient of thermal expansion (CTE) match between the modified mullite coating and silicon-containing substrate than the coefficient of thermal expansion match between the mullite coating without the modifier and the silicon-containing substrate. (2) The modifier component provides a phase or phases that reduce the overall elastic modulus of the modified mullite coating to reduce thermal stress in said coating. (3) The modifier component provides a phase or phases that serve as crack arresters to increase, resistance of the modified mullite coating to crack propagation. The modifier component increases the toughness of the modified mullite coating.

The modified mullite coating is applied to a silicon-containing substrate. Suitable silicon-containing substrates comprise materials that result in cracking of an applied mullite coating. The silicon-containing substrate can comprise a ceramic such as a silicon-based ceramic. Examples are silicon carbide, silicon nitride, silicon carbon nitride, silicon oxynitride, and the like. The silicon-containing ceramic substrate can be a monolith or composite.
A composite can comprise a silicon, silicon carbide, carbon or silicon-silicon carbide matrix composite processed by silicon carbide fiber-reinforced silicon nitride composite, The preferred substrate comprises a silicon carbide fiber-reinforced silicon-silicon carbide matrix composite processed by silicon melt infiltration.

Also suitable as silicon-containing substrates are silicon metal alloys. These alloys include niobium silicon alloys, molybdenum silicon alloys and the like.

The coated article of the invention can comprise a thermal barrier coating applied to the modified mullite coating. Suitable external environmental/thermal barrier coatings include chemically stabilized zirconias, such as yttria-stabilized zirconia (YSZ). The amount of modifier component addition can be co-depositing mullite with a low thermal expansion modifier such as cordierite, fused silica or celsian (BaO·Al₂O₃·2SiO₂) on silicon-containing ceramic substrates or ceramic composite substrates imparts an improved thermal expansion match of the modified mullite coating with the silicon-containing substrate than with a monolithic mullite coating.

Cordierite is an incongruently melting compound with mullite formed first when cooling from the liquid phase. Upon quenching from the melt splash during the plasma spray, it may remain as a glassy material or mullite with a glass phase. This may require a post-spray annealing process at appropriate temperatures to convert the material to cordierite. The amount of modifier component addition can be first estimated by the rule of mixture estimate. But because of the complexity of phase composition in the system, a trial and error process may have to be executed before an optimal proportion is reached.

The mullite coating with the modifier component can be applied to the silicon-containing substrate by any suitable method including thermal spray, air plasma spray (APS) and vacuum or low pressure plasma spray (VPS or LPPS), high velocity oxy-fuel (HVOF) spray, vapor deposition, including chemical vapor deposition (CVD), physical vapor deposition (PVD) and solution techniques such as sol-gel slurry coating or colloidal suspension coating. A constituent start-
may be premixed through a vigorous mechanical process, such as ball milling, to provide interlocking of the powders and prevent segregation of phases due to density differences. For the same purpose, a sol-gel or colloidal process may be employed to coat the particles of one constituent with another.

Sarin et al., U.S. Patent No. 5,763,006 and Lee et al., U.S. Patent No. 5,496,644 describe exemplary methods of applying mullite coatings. The disclosures of these patents are incorporated hereinby reference. Sarin et al. discloses a chemical deposition process comprising steps of establishing a flow of reactants which will yield mullite in a CVD reactor, and depositing a crystalline coating from the reactant flow. Lee et al. discloses a method of plasma spraying mullite coatings onto silicon-based ceramic materials. The method prevents deposition of amorphous mullite by heating the silicon-containing substrate to a very high temperature (greater than 1000 C) during the spraying process.

The following examples are illustrative of the invention.

**EXAMPLES**

Powders of Ca0.5Al,0.5Si0.5 (CAS) (22 vol %) and (BaO)0.67(SrO)0.33Al2O3Si2O5 (BSAS) (18 vol %) were added to mullite powder by ball milling, respectively. The composite powders were sprayed using air plasma spray (APS) onto a silicon carbon fiber reinforced silicon carbide-silicon matrix composite substrate processed by melt infiltration. The substrate temperature was kept at 1050 to 1250 C. The plasma torch model was Electro-plasma 03CA, with 45 kW power, argon (14.4 SLM) as primary gas and helium (9.8 SLM) as secondary gas. Plasma torch to substrate distance was 4". A top coat of yttria-stabilized zirconia (YSZ) was applied on top of the composite mullite coating by air plasma spray using standard operating procedures for thermal barrier coatings. A baseline sample of monolithic mullite coating on the ceramic composite substrate was also prepared using the thermal spray technique with a yttria-stabilized zirconia topcoat.

Samples of silicon-containing ceramic substrates with the modified mullite and thermal barrier coatings and monolithic mullite coatings were subjected to an environmental furnace test with two hour cycles from room temperature to 1300 C. for 500 hours in 90% H2O 10% O2. The results are shown in FIGS. 3-5. FIG. 3 shows that through-thickness cracks developed in the baseline sample with the monolithic mullite coating. Extensive oxidation of the silicon-based ceramic composite at the mullite/substrate interface resulted in failure of the mullite coating (environmental barrier coating) during the test.

In contrast, the composite modified mullite coatings shown in FIGS. 4 and 5 exhibited no through-thickness cracks in the modified mullite coating and the coatings survived the test with minimal change at the modified mullite coating/substrate interface.

What is claimed:

1. An article comprising:
   a silicon-containing substrate; and
   a modified mullite coating comprising mullite and a modifier component that reduces cracks in the modified mullite coating, wherein said modifier component comprises an alkaline earth aluminosilicate.

2. The article of claim 1, wherein said silicon-containing substrate is a monolithic or composite silicon carbide/silicon ceramic.

3. The article of claim 1, wherein said silicon-containing substrate is a monolithic or composite silicon nitride.

4. The article of claim 1, wherein said modifier component comprises a lower thermal expansion component than mullite that imparts a closer coefficient of thermal expansion match between a modified mullite coating and said silicon-containing substrate, wherein a volume fraction of the modifier component in the modified mullite coating is proportionate to a ratio of a coefficient of thermal expansion of the silicon-containing substrate and the coefficient of thermal expansion of the modifier component and the coefficient of thermal expansion of the mullite.

5. The article of claim 1, further comprising an external environment/thermal barrier coating applied to said mullite coating.

6. The article of claim 5, wherein said modified mullite coating functions as a bond coating between said external environmental/thermal barrier coating and said silicon-containing substrate.

7. The article of claim 5, wherein said thermal barrier coating comprises yttria-stabilized zirconia, scandia-stabilized zirconia, calcia-stabilized zirconia, magnesia-stabilized zirconia, alumina or alumina silicate.

8. An article comprising:
   a silicon-containing substrate; and
   a modified mullite coating comprising mullite and a modifier component that reduces cracks in the modified mullite coating, wherein said modifier component comprises a modifier component of the formula MO.Al2O5.xSiO2, where M is selected from the group consisting of Ca, Sr, and Ba, and 1 ≤ x ≤ 3.

9. An article comprising:
   a silicon-containing substrate; and
   a modified mullite coating comprising mullite and a modifier component that reduces cracks in the modified mullite coating, wherein said modifier component comprises barium feldspar (BaO.Al2O3Si2O5), strontium feldspar (SrO.Al2O3Si2O5) or a combination of barium feldspar (BaO.Al2O3Si2O5) and strontium feldspar (SrO.Al2O3Si2O5).

10. An article comprising:
    a silicon-containing substrate; and
    a modified mullite coating comprising mullite and a modifier component that reduces cracks in the modified mullite coating, wherein said modifier component comprises barium strontium aluminosilicate (BSAS), calcium aluminosilicate (CAS), or yttrium silicate (YSZ) or a combination thereof.

11. An article comprising:
    a silicon-containing substrate; and
    a modified mullite coating comprising mullite and a modifier component that reduces cracks in the modified mullite coating, wherein said modifier component comprises barium strontium aluminosilicate (BSAS), calcium aluminosilicate (CAS), yttrium silicate (YSZ) or a combination thereof.

12. An article comprising:
    a silicon-containing substrate; and
    a modified mullite coating comprising mullite and a modifier component that reduces cracks in the modified mullite coating, wherein said modifier component comprises barium strontium aluminosilicate (BSAS), calcium aluminosilicate (CAS), or yttrium silicate (YSZ) or a combination thereof.

13. An article comprising:
    a silicon-containing substrate; and
    a modified mullite coating comprising mullite and a modifier component that reduces cracks in the modified mullite coating, wherein said modifier component comprises NaZr2P3012, Ba1.25Zr2P5.5Si10.5O24, Ca0.5Sr0.5Zr6(PO4)6 or Ca0.5Mg0.5Sr(PO4)6.
14. An article comprising:
   a silicon-containing substrate; and
   a modified mullite coating comprising mullite and a
   modifier component that reduces cracks in the modified
   mullite coating, wherein said modifier component com-
   prises 3CaO·5Al₂O₃ or Al₂O₃·TiO₂.

15. An article comprising:
   a silicon-containing substrate; and
   a modified mullite coating comprising mullite and a
   modifier component that reduces cracks in the modified
   mullite coating, wherein said modifier component com-
   prises a calcium aluminate or an aluminum titanate.

16. A coated article comprising a silicon/silicon carbide
   composite having silicon carbide-containing fibers; a modi-
   fied mullite coating comprising mullite and barium stron-
   tium aluminosilicate (BS/AS), that reduces cracks in the
   modified mullite coating; and optionally a yttria-stabilized
   zirconia coating on the modified mullite coating.
