ABSTRACT

A system and methods through which pictorial views of an object's configuration, arranged in a hierarchical fashion, are navigated by a person to establish a visual context within the configuration. The visual context is automatically translated by the system into a set of search parameters driving retrieval of structured data and content (images, documents, multimedia, etc.) associated with the specific context. The system places "hot spots", or actionable regions, on various portions of the pictorials representing the object. When a user interacts with an actionable region, a more detailed pictorial from the hierarchy is presented representing that portion of the object, along with real-time feedback in the form of a popup pane containing information about that region, and counts-by-type reflecting the number of items that are available within the system associated with the specific context and search filters established at that point in time.

FIG. 15
1

IMAGE AND INFORMATION MANAGEMENT SYSTEM

The invention described herein was made in the performance of work under NASA Contract No. NAS9-20000 and is subject to the provisions of Section 305 of the National Aeronautics and Space Act of 1958 (42 U.S.C. 2457).

This application includes material which is subject to copyright protection. The copyright owner has no objection to the facsimile reproduction by anyone of the patent disclosure, as it appears in the Patent and Trademark Office files or records, but otherwise reserves all copyright rights whatsoever.

FIELD

The present disclosure relates to the field of information systems, and more particularly provides a system and method through which images of and information about an object can be stored, organized, and searched to facilitate ease of retrieval and use.

BACKGROUND

The efficient storage, search, and retrieval of information has long been a problem. From filing cabinets full of paper to hard-drives full of data, individuals, businesses, and governments have struggled to find good organization techniques. The advent of databases and enhanced search and indexing algorithms has made it easier to find desired electronic data. For example, Liu et al., U.S. Patent Application Publication No. 2005/0114325, published May 26, 2005, and Liu, U.S. Patent Application Publication No. 2005/0010553, published Jan. 13, 2005, disclose a semi-automatic means for annotating multimedia objects which also permits retrieval of the multimedia objects. The annotation process annotates multimedia objects, such as digital images, with semantically relevant keywords. Such annotation is performed in the background, with the results presented to the user for verification. The user can also add his or her own keywords or other annotation information. Similarly, Remsen et al., U.S. Patent Application Publication No. 2003/0167283, published Sep. 4, 2003, discloses a system for managing taxonomic information regarding biological organisms that allows researchers to quickly retrieve information on a given organism regardless of the name associated with the information.

While such systems can be advantageous where the information to be cataloged is mostly text or includes textual metadata, searching a set of multimedia objects, such as images, sounds, or video, for a particular item of interest can be difficult. Stubler et al., U.S. Pat. No. 6,804,684, issued Oct. 12, 2004, discloses a method for associating semantic information with multiple images in an image database environment. Stubler discloses generating captions or semantic labels for an acquired image based upon similarities between the acquired image and one or more stored images, where the stored images have pre-existing captions or labels. Similarly, DeBonet, U.S. Pat. No. 5,819,288, issued Oct. 6, 1998, discloses a statistically based image group descriptor for use in an image classification and retrieval system. DeBonet discloses an apparatus and method for generating a semantically based, linguistically searchable, numeric descriptor of a pre-defined group of input images which can automatically classify individual images to allow for rapid identification of similar images.

The systems described above facilitate searching by annotating a database entry with a keyword. Where the data may be organized by a plurality of key words, or where the data may not have appropriate key words, database searches may not return the entire set of available information, and thus valuable information may be effectively inaccessible when needed. Matsuzaki et al., U.S. Pat. No. 6,804,683, issued Oct. 12, 2004, attempts to overcome those deficiencies by disclosing a means for retrieving similar images that allows a user to specify a "region of interest", and compares a "feature quantity calculation" of the region to the quantity calculation of other images in the database. The search results are presented in order of decreasing similarity from the image database.

It can clearly be difficult to find appropriate data in a database, and the techniques described above have been developed to improve search results. Once the search results are obtained, the next concern is the presentation of these search results. Baker, U.S. Patent Application Publication No. 2002/0047856, published Apr. 25, 2002, discloses a method of providing access to a collection of images through a single web page, which Baker refers to as "stacked images." Baker discloses building a database that represents a plurality of separate images, and then displaying at least one of these images. When a user clicks the image, the next image in the "stack" is displayed. Lennon et al., U.S. Patent Application Publication No. 2003/0018607, published Jan. 23, 2003, discloses a system for allowing a user to search different metadata collections over the Internet. Lennon discloses dynamic generation of an XML description of an associated metadata collection that reflects a structure by which the associated metadata collection may be browsed. This structure includes XML schema definitions of types for Categories, Subcategories, Classes, and Images. Lennon discloses that each declared descriptor within the defined type inherits a visualIdentifier attribute which is used by a media browser to provide visual representation of the content of the item. For example, if the item is an image then the visualIdentifier attribute value will typically contain a URI of a thumbnail of the image; if the item is a Category, Subcategory, or Class, then the URI may point to an icon. If the attribute is not present, the media browser generates a visual identifier for the item from a provided textIdentifier attribute value or from the name of the element.

While several different techniques exist for the search, retrieval, and presentation of information, most are too cumbersome to be useful in instances where time is of the essence, or where it is critical that the all relevant information be presented without overwhelming the user. For example, Remsen's system is intentionally over inclusive, and provides information about related species in addition to the species for which the user is searching. Similarly, Stubler's and DeBonet's search techniques are likely to both include information that is not relevant, and to overlook relevant images.

SUMMARY

Accordingly, the instant disclosure is directed to an image and information management system that substantially obviates one or more of the problems due to limitations and
disadvantages of the related art. As used herein, the term image includes photographs, line art, computer renderings, animation, motion video, and the like, and is not intended as limited to a particular type of image.

The present disclosure describes a system and methods for allowing users to access relevant information about an object quickly and easily. An object can be a physical item such as a spacecraft or aircraft, a piece of hardware or equipment, a facility, a building, or a piece of machinery, among others, or an abstract item such as a schematic, a flow diagram, an illustration, or a representation of a business function, and the like.

The instant disclosure also describes a system and method for providing a graphical, drill-down interface through which information about an object can be accessed. The instant disclosure also describes a system and method for providing a structured interface through which information about an object can be captured and cataloged. Additional features and advantages will be set forth in the description which follows, and in part will be apparent from the description, or may be learned by practice of the disclosure. The objectives and other advantages of the disclosed image and information management system will be realized and attained by the structure particularly pointed out in the written description and claims hereof as well as the appended drawings.

In many instances, the information storage and retrieval systems in the prior art are sufficient for business purposes. However, where time is of the essence, such as occurs in an assembly line; in the manufacture and maintenance of mission-critical equipment such as aircraft or watercraft; during fire and other emergencies; and the like, it is critical that users be able to quickly and easily access all relevant information. By way of example, without limitation, any delays in the launch of a spacecraft can have significant economic impact upon the entire operation. From manpower costs due to missed launch windows and contract-related fines to additional fuel and real estate costs, every minute launch is delayed has a significant economic impact. Similarly, where the object is not available for analysis, such as in an orbiting spacecraft, or where the object is effectively inaccessible, such as the wiring of an aircraft while the aircraft is in flight, the antenna array on a submarine while the submarine is at depth, or an underwater valve assembly on an oil rig, it can be advantageous to have well documented and readily accessible information. By way of example, without limitation, troubleshooting on-orbit or in-flight anomalies in a spacecraft requires timely access to spacecraft configuration data in the form of imagery and information. Review of configuration imagery is critical to quickly developing in-flight repair procedures. In these and other scenarios, it is essential that, when there is a problem, those addressing the problem have reliable access to the pertinent information about the object that is the subject of the problem. The instant disclosure provides a system and methods through which users can gain rapid and reliable access to such information.

A graphical, image-based interface consisting of a hierarchically structured collection of integrated pictorial views of an object’s configuration can be presented to one or more users. The hierarchy of pictorial views enables users to establish a visual context within the object’s configuration that defines search parameters driving retrieval of information associated with the specific context. For example, users can access and refer to photographs, engineering drawings, line-art, or images of a spacecraft associated with a visual context established for the information retrieval search. The system can allow users to drill down quickly to a visual context within the object, such as drilling down to a faulty component within the object, by simply clicking on or otherwise interacting with (henceforth referred to herein as clicking, for clarity) “hotspots”, actionable regions, or zones in an image or successive images.

The interface can automatically translate the user’s interactions into search parameters, which are then used as a basis for information retrieval, including accessing a next-lower level of an image or “drilldown” hierarchy where appropriate. The retrieved information can include images of a selected component, including photographs taken during the manufacture and/or assembly of the individual component as well as those taken during the component’s installation. In addition, information about the photographed component, such as, without limitation, part and serial number(s) of items within the component, schematics, dates of manufacture, installed software and version numbers, lot numbers, chemical composition, test results, related tools, and the like can also be made available to the user.

A standardized interface is also provided through which information about the component, including component photographs, can be cataloged and stored. This embodiment can also integrate with and monitor other information databases, such as document management systems and, using eXtensible Markup Language (“XML”)–based tags, Standardized Generalized Markup Language (SGML)–based tags, key words, and the like stored within a document or in document-related metadata, automatically associate the document with appropriate information stored in the system.

The image and information management system has application in numerous commercial and government settings. By way of example, without limitation, any commercial entity with requirements for visual, as-built, or operational configuration baselines can benefit from such a system. Such commercial entities may include, but are not limited to, companies engaged in oil and gas extraction, mining, petroleum refining, chemical production, power generation or heavy construction who operate complex sets of equipment and facilities supporting their core business functions. These companies can benefit from the Visual Configuration Baselines (“VCBs”) created and maintained through the system by making imagery, documentation, test results, test data, engineering models, additional items in inventory, and other critical data readily available for troubleshooting, problem resolution, product and process design, operations or analytical purposes.

The system also provides browser-integrated, in-line viewing tools to support examination of high-resolution photographs, and browser-integrated Digital Content Capture tools for assembling and storing information (structured data and multi-media content) associated with the object. The information is stored in relational form in a commercial, off the shelf (COTS) document management system.

The system provides a very simple and reliable search/retrieval interface by moving the burden of specifying the exact interrelated attribute search criteria from the user to the underlying search system with the user being responsible for inputting only a small number of commonly known search values in an easy and intuitive fashion. Once the user provides a minimum input set, the system transparently generates a fully qualified set of search criteria that accurately returns a result set corresponding to the visual context and filters established by the user.

The image and information management system can function as part of an overall tool set through which a space flight can be monitored and controlled from early conception.
and design phases through execution. Such a system preferably includes a tool for automating crew scheduling, wherein the tool can automatically adjust crew schedules based on changes in circumstances, such as changes in vehicle attitude and trajectory. Additionally, the tool can display photographs or locations (zones) managed by the system through integrated hypertext links embedded within crew procedure documents used to accomplish tasks onboard a space flight vehicle.

The overall system may also include a real-time space-flight trajectory tool, which calculates current and projected trajectories based on information about the vehicle. In such a system, the trajectory tool can monitor information from the vehicle, such as attitude maneuvers, altitude changes (e.g., away from a celestial body, closer to the celestial body, etc.), or actual vehicle position in space to update the vehicle’s trajectory. As described herein, by monitoring these trajectory changes, the overall system can dynamically monitor and adjust crew schedules to more efficiently use the vehicle’s resources and help the crew and ground or support personnel deal with and diagnose problems.

It is to be understood that both the foregoing general description and the following detailed description are exemplary and explanatory and are intended to provide further explanation of the invention as claimed.

**BRIEF DESCRIPTION**

The accompanying drawings, which are included to provide a further understanding of the invention and are incorporated in and constitute a part of this specification, illustrate embodiments of the invention and together with the description serve to explain the principles of at least one embodiment of the invention.

In the drawings:

**FIG. 1** is a block diagram of a computer architecture supporting an embodiment of the disclosed image and information management system.

**FIG. 2** is a block diagram illustrating a conceptual software architecture for implementing an embodiment of the disclosed image and information management system.

**FIG. 3** is an alternative block diagram of the architecture of FIG. 1.

**FIG. 4** is a screen capture of a high-data-level user interface as implemented in an embodiment of the disclosed image and information management system.

**FIG. 5** is a screen capture of an intermediate-data-level user interface as implemented in an embodiment of the disclosed image and information management system.

**FIG. 6** is a screen capture of an alternative high-data-level user interface as implemented in an embodiment of the disclosed image and information management system.

**FIG. 7** is a partial screen capture of an alternative intermediate-data-level user interface as implemented in an embodiment of the disclosed image and information management system.

**FIG. 8** is a screen capture of a lower-data-level user interface as implemented in an embodiment of the disclosed image and information management system.

**FIG. 9** is a screen capture of a low-data-level user interface as implemented in an embodiment of the disclosed image and information management system.

**FIG. 10** is a screen capture of a detailed photograph and an image control toolbar for controlling display of the photograph, as implemented in an embodiment of the disclosed image and information management system.

**FIG. 11** is a screen capture of an image control toolbar as implemented in an embodiment of the disclosed image and information management system.

**FIG. 12** is a screen capture of an image selection user interface as implemented in an embodiment of the disclosed image and information management system.

**FIG. 13** is a screen capture of an image attribute data entry interface as implemented in an embodiment of the disclosed image and information management system.

**FIG. 14** is a screen capture of an orbiter/vehicle documentation log interface as implemented in an embodiment of the disclosed image and information management system.

**FIG. 15** is a block diagram of an alternative computer architecture for implementing an embodiment of the disclosed image and information management system.

**FIG. 16** is a block diagram illustrating a process through which the image and information management system can be integrated into business processes.

**DETAILED DESCRIPTION**

Reference will now be made in detail to the embodiments of the disclosed image and information management system, examples of which are illustrated in the accompanying drawings.

**FIG. 1** is a block diagram of a computer architecture supporting an embodiment of the disclosed image and information management system. The illustrated architecture is an “n-tier” architecture that is implemented in three tiers: client/presentation tier 100, application/business logic tier 110, and data/content tier 120. The client/presentation tier 100 represents the client computers through which users can interact with and retrieve information from the application/business logic tier 110 and the data/content tier 120. The application/business logic tier 110 represents computer hardware and software responsible for managing information storage and retrieval, user interface generation, and the like. The data/content tier 120 represents physical data storage.

In **FIG. 1**, Camera 102 is used to collect photographs of various components. These photographs are transferred to Computer 104, where the photographs and other images are organized and cataloged for storage by eContent Server 112 as files in a file system 122 and/or a database 124. Once stored therein, the pictures are made available to Computers 106 and 108 via web server 116, which presents data collected from eContent Server 112 by Application Server 114 based on user requests.

**FIG. 2** is a block diagram illustrating a software architecture for implementing an embodiment of the disclosed image and information management system. In **FIG. 2**, Application Design layer 200 is responsible for controlling access to lower layers and for providing an interface through which users can retrieve data from database and file system 230. Application Design layer 200 is built around model 206, which has knowledge of the data structures used by the lower layers and is responsible for translating user information requests into requests serviceable by the lower layers. View 204 is responsible for translating information from Model 206 into an appropriate user interface. Controller 202 manages the evaluation of information from the user interface and translation of such information into a format usable by Model 206.

Service Framework 210 provides an interface to the underlying database and file system 230. Service Framework 210 receives requests from Model 206 and routes them to an appropriate data-access interface, such as Documentum® Foundation Classes (“DFC”) 212. DFC 212 allows Service Framework 212 to access information stored in a traditional content management or document management system. An advantage to the use of a Service Framework-like layer is the ability to insert new data access “drivers” into the system without having to rearchitect the entire system.
Application Context 220 represents traditional data storage and server software and/or hardware that together enable solutions for developing, deploying, and managing multi-tier server-centric applications.

FIG. 3 is an alternative block diagram of the architecture of FIG. 1. In FIG. 3, Presentation Tier 300 includes request/response interface 310. Request/response interface 310 is preferably created by an Hypertext Markup Language ("HTML")/Java Server Pages server, and can be comprised of three main components. The first component, controller 314, is responsible for receiving user input from views 318 and transferring the information to Data Access 320 (described below). Controller 314 also receives information from Security and Session APIs 324 and transfers the information to the user via views 318 based on user selections in Filters 312.

One aspect of controller 314 can communicate with Security and Session APIs 324 via tag libraries 316. Tag libraries 316 provide controller 314 with information about the underlying data structure used by Security and Session API’s 324. Security and Session API’s 324 receive information requests from and transfers information to controller 314. Security and Session API’s 324 can distinguish between requests for information contained in a relational database (illustrated as RDBMS 332) and files stored as part of the file system (illustrated as File System 334) and route the request through an appropriate handler, such as Content APIs 326 and Query Language 322.

FIG. 4 is a screen capture of a high-data-level user interface as implemented in an embodiment of the disclosed image and information management system. In this embodiment, the user is presented with an overall image of the object in question 400, in this case, a Space Shuttle Vehicle ("SSV"), external fuel tank ("ET"), and solid rocket boosters ("SRB"). This image represents the highest level of the drilldown hierarchy. By clicking on one of the SSV, the ET, or an SRB, the user is taken to a screen similar to either SSV 420 or ET/SRB 600 of FIG. 6, respectively. The images contained in these screens represent the next lower level of the drilldown hierarchy.

Referring again to image 400, if the user is interested in accessing information about a portion of the SSV, the user selects the SSV, and is presented with a view similar to SSV 420. SSV 420 can provide a high-level, exploded view of a typical SSV, or the image can be used to represent a specific SSV configuration based on a particular mission (STS 411) chosen by the user from "dashboard" 410.

FIG. 5 is a screen capture of an intermediate-data-level user interface embodiment. By clicking on wing 422 of FIG. 4, the display can change to provide an exploded view of the wing, as illustrated in block 512. The user can click on a portion of the illustrated wing, such as Left Wing Torque Box Leading Edge Zone 741, to display a more detailed image, such as that illustrated in FIG. 7. FIG. 7 is a partial screen capture of an alternative intermediate-data-level user interface embodiment. Information about a given wing component, such as component 710, can be obtained by hovering a pointer over a given component, right-clicking on the component, or otherwise interacting with the component. Such information may be presented in a component-specific information display such as component information 720. By double-clicking on the component or otherwise interacting with the component, the user can cause the display to change to one similar to that illustrated in FIG. 8.

FIG. 8 is a screen capture of a lower-data-level user interface embodiment. FIG. 8 presents a series of thumbnail photographs 810 of component 710 of FIG. 7. The photographs having been taken during assembly, maintenance, or the like of the component. By clicking on or otherwise interacting with a photograph, the user can cause the display to change to one similar to that of FIG. 9.

FIG. 9 is a screen capture of a low-data-level user interface embodiment. In FIG. 9, another thumbnail photograph 910 of component 710 is presented with information 920 about the thumbnail and the component or components in the photograph. Such information may include, but is not limited to, the date on which the photograph was taken, the vehicle into which the component or components are installed, the photographer’s name, a description of the contents of the photograph, and the like. By clicking on thumbnail photograph 910, the display can change to one similar to that illustrated in FIG. 10.

FIG. 10 is a screen capture of a detailed photograph and an image control toolbar embodiment, wherein the image control toolbar permits the user to control the display of the photograph. By default, the display illustrated in FIG. 10 preferably scales the photograph to the largest size possible consistent with the screen or other device on which the photograph is being displayed to the user. Panning the photograph within the display window can be accomplished by operating scroll bars associated with the image, by clicking on the image to bring up a specialized move cursor that "sticks" to the image and allows the photograph to be moved in any direction within the confines of the display window (not illustrated), or other such means.

FIG. 11 is a screen capture of an image control toolbar embodiment. As FIG. 11 illustrates, the toolbar may also include a unique photograph or image identifier 1105. The toolbar may also allow the user to zoom in using control 1120 or zoom out using control 1110, view the photograph at its actual resolution using control 1130, and rotate the photograph using control 1140. The toolbar may also allow the user to easily resize the photograph to fit the screen using control 1135. The toolbar may also allow the user to rotate the photograph by fixed amounts 1140. The user can also start a new search based on data attributes of photographs using control 1145. The user can report a misfiled or incorrectly classified photograph using control 1170, and quickly return to the thumbnail interface illustrated in FIG. 8 by interacting with button 1150. Interacting with a "close" button or the like (not illustrated) can cause the display to return to a default interface view, such as that illustrated in FIG. 4.

The user interfaces, or screens, illustrated in FIGS. 4-11 allow the user to quickly navigate to all information about a component in question via a hierarchical interface. The interface uses the user’s selections as a basis for searching a database for information related to the presented image or component. To facilitate entry of images, photographs, and related information into the system, an embodiment of the invention preferably includes well-structured user interfaces that simplify the organization and data entry tasks.

FIG. 12 is a screen capture of an image selection user interface embodiment. In this interface, the user can select the drive or other device 1205 on which one or more images are stored and, from that device, the path to the folder or directory 1210 containing the images. List box 1215 enumerates all images in the selected folder or directory, and the user can select one or more entries for importation into the system. Select all button 1218 allows the user to quickly select all images listed in list box 1215, and de-select button 1219 clears list box 1215 of all selected images. By clicking cancel button 1230, the user can cancel the image importation process. When the user has selected the images to be imported, the user can click download button 1220. The images are then imported into the system for further processing.

FIG. 13 is a screen capture of an image attribute data entry interface embodiment. Once the images are imported into the system, the user is presented with thumbnails 1305 of...
The user can also enhance and annotate an image by clicking button 1335. Such enhancements may include, but are not limited to, adjusting the lighting levels in an image, adjusting the contrast or brightness, correcting the color, and the like. Users may be prevented from directly editing image content. Further, the system may maintain copies of all images, both pre-edit and post-edit, along with a record of the user making the edits. If a user is not satisfied with the changes made, the user can click button 1345 to revert to the previously stored image. The annotations can include comments and notes about the image.

The system allows the user to view a larger version of a selected image by clicking button 1340. This can cause the display to change to one similar to that of FIG. 10, with a toolbar similar to that of FIG. 11.

In this role, application server 1512 can receive photographs are available for technicians repairing, maintaining, or otherwise interacting with the component that is the subject of the WAD. Such work instructions 1610 can include instructions on when to photograph the component, how to orient the component within the photograph, key aspects of the component to be included in the photograph, and the like. Although reference is made herein to photographs, it should be apparent to one skilled in the art that the process can be readily adapted to allow the image and information management system to be integrated into alternative business processes without departing from the spirit or the scope of disclosed image and information management system.

When the buttons are clicked, an alternative user interface can be provided which allows the user to further define the component illustrated in the image. This allows the user to quickly associate the image with an appropriate portion of the entire assembly, and thus to appropriately locate the image within the drilldown hierarchy. FIG. 14 is an example of a user interface providing an orbiter/vehicle documentation log interface.

FIG. 15 is a block diagram of an alternative computer architecture embodiment. The illustrated architecture is an “n-tier” architecture that is implemented in three tiers, Internet 1500, Middle Tier 1510, and EIS Tier 1520. Internet tier 1500 provides an interface to the functions and data presented via the other tiers, and can do so directly through the interface with web server 1512, or indirectly via the interface provided by web services 1505.

Each of the imported images, and with various tools to assist with the importation process. The user can add additional images by clicking button 1355, delete a selected image by clicking button 1360, undelete an image by clicking button 1365, and undelete all deleted images by clicking button 1370.

When the buttons are clicked, an alternative user interface can be provided which allows the user to further define the component illustrated in the image. This allows the user to quickly associate the image with an appropriate portion of the entire assembly, and thus to appropriately locate the image within the drilldown hierarchy. FIG. 14 is an example of a user interface providing an orbiter/vehicle documentation log interface.

FIG. 14 is an example of a user interface providing an orbiter/vehicle documentation log interface.
1. An information management system comprising:
   a first database comprising one or more data tables,
   wherein the first data table stores at least one of the plurality of components,
   wherein the second data table stores at least one relationship between the plurality of components and the first data table,
   wherein the third data table stores at least one actionable region associated with the displayed at least one component,
   wherein the displayed at least one component and the displayed at least one actionable region are part of the same data table,
   wherein the displayed at least one component and the displayed at least one actionable region are both displayed in the same display frame,
   wherein the displayed at least one component and the displayed at least one actionable region are displayed in a split screen mode;

2. The system of claim 1, further comprising:
   a user interface, wherein the user interface displays the at least one component and the at least one actionable region;
   a user interface, wherein the user interface allows the user to perform at least one of the following actions:
     - zoom in, zoom out, and rotate the displayed image;
     - display a toolbar when the at least one component is displayed;
     - monitor the user's actions to determine when one of the at least one actionable regions has been activated;
     - display a split screen mode when the at least one component is displayed;

3. The system of claim 2, wherein the user interface further comprises:
   a dashboard, wherein the dashboard displays at least one of the following:
     - a toolbar when a component image is displayed;
     - a split screen mode when a component image is displayed;
     - a display of the at least one component and the at least one actionable region in a split screen mode;

4. The system of claim 3, wherein the dashboard further comprises:
   a toolbar, wherein the toolbar includes at least one of the following:
     - a zoom in, zoom out, and rotate button;
     - a split screen mode button;
     - a display of the at least one component and the at least one actionable region in a split screen mode button;

5. The system of claim 4, wherein the user interface further comprises:
   a user interaction monitor, wherein the user interaction monitor monitors user actions to determine when one of the at least one actionable regions has been activated;

6. The system of claim 5, wherein the user interaction monitor further comprises:
   a user action controller, wherein the user action controller performs at least one of the following actions:
     - activating an actionable region when a user's action matches a predefined action;
     - deactivating an actionable region when a user's action does not match a predefined action;
     - displaying a split screen mode when the at least one component and the at least one actionable region are both displayed in the same display frame;

7. The system of claim 6, wherein the user action controller further comprises:
   a user action classifier, wherein the user action classifier classifies user actions as at least one of the following:
     - mouse click;
     - mouse double click;
     - mouse drag;
     - mouse scroll;

8. The system of claim 7, wherein the user action classifier further comprises:
   a user action detector, wherein the user action detector detects user actions as at least one of the following:
     - mouse click detection;
     - mouse double click detection;
     - mouse drag detection;
     - mouse scroll detection;

9. The system of claim 8, wherein the user interaction monitor further comprises:
   a display controller, wherein the display controller displays the at least one component and the at least one actionable region in the same display frame.

10. The system of claim 1, wherein the user interface further comprises:
    a user interface monitor, wherein the user interface monitor monitors user actions to determine when one of the at least one actionable regions has been activated;

11. The system of claim 10, wherein the user interface monitor further comprises:
    a user interaction controller, wherein the user interaction controller performs at least one of the following actions:
      - activating an actionable region when a user's action matches a predefined action;
      - deactivating an actionable region when a user's action does not match a predefined action;
      - displaying a split screen mode when the at least one component and the at least one actionable region are both displayed in the same display frame;

12. The system of claim 11, wherein the user interaction controller further comprises:
    a user action classifier, wherein the user action classifier classifies user actions as at least one of the following:
      - mouse click;
      - mouse double click;
      - mouse drag;
      - mouse scroll;

13. The system of claim 12, wherein the user interaction controller further comprises:
    a user action detector, wherein the user action detector detects user actions as at least one of the following:
      - mouse click detection;
      - mouse double click detection;
      - mouse drag detection;
      - mouse scroll detection;

14. A method of presenting information to a user, comprising:
    receiving at least one image of an object;
    receiving a plurality of images of a plurality of components;
    receiving at least one image of an object;
    associating the stored first information with an appropriate one of the plurality of components;
    displaying for a user at least one image of the object;
    associating an action with the at least one first actionable region;
    associating at least one second actionable region with at least a subset of the plurality of images of the plurality of components;
    an actionable region;
    displaying for the user at least one of the plurality of component images;
    displaying for the user at least one of the plurality of component images;
    displaying for the user at least one of the plurality of component images;
    displaying for the user at least one of the plurality of component images;
    displaying for the user at least one of the plurality of component images;

15. The method of claim 14, wherein the at least one action associated with a second actionable region comprises:
    displaying information about the component in the image containing the second actionable region;
    displaying information about the component in the image containing the second actionable region;
    displaying information about the component in the image containing the second actionable region;
    displaying information about the component in the image containing the second actionable region;
    displaying information about the component in the image containing the second actionable region;

16. The method of claim 15, further comprising:
    displaying a toolbar when the at least one of the plurality of images of the plurality of components is displayed for the user.
    displaying a toolbar when the at least one of the plurality of images of the plurality of components is displayed for the user.
    displaying a toolbar when the at least one of the plurality of images of the plurality of components is displayed for the user.
    displaying a toolbar when the at least one of the plurality of images of the plurality of components is displayed for the user.
    displaying a toolbar when the at least one of the plurality of images of the plurality of components is displayed for the user.

17. The method of claim 16, wherein the toolbar permits the user to at least zoom in, zoom out, and rotate the displayed image.
    the toolbar permits the user to at least zoom in, zoom out, and rotate the displayed image.
    the toolbar permits the user to at least zoom in, zoom out, and rotate the displayed image.
    the toolbar permits the user to at least zoom in, zoom out, and rotate the displayed image.
    the toolbar permits the user to at least zoom in, zoom out, and rotate the displayed image.

18. The method of claim 17, further comprising:
    displaying a dashboard when any of the at least one images of the object are displayed.
    displaying a dashboard when any of the at least one images of the object are displayed.
    displaying a dashboard when any of the at least one images of the object are displayed.
    displaying a dashboard when any of the at least one images of the object are displayed.
    displaying a dashboard when any of the at least one images of the object are displayed.

19. The method of claim 18, wherein the dashboard permits the user to easily move between objects.
    the dashboard permits the user to easily move between objects.
    the dashboard permits the user to easily move between objects.
    the dashboard permits the user to easily move between objects.
    the dashboard permits the user to easily move between objects.
    the dashboard permits the user to easily move between objects.

20. The method of claim 19, wherein the displaying of at least one of the plurality of component images and the monitoring of user actions to determine when one of the at least one actionable regions associated with the displayed at least one component images has been activated are iteratively repeated, thereby permitting the user to drill down to a desired component.
