Comparative Packaging Study
Michele Perchonok and David Antonini
NASA Advanced Food Technology
Johnson Space Center, Houston

PERFORMANCE
- Evaluate new high barrier food packaging films for use on long duration space missions.
- Determine the effects of:
  - High temperatures during heat sealing
  - Stress cracking from folds in the films caused by vacuum packing
  - Relative humidity during storage

Deliverables
- Quantitatively evaluate each packaging material after final processing for oxygen and water vapor transmission through analysis of ingredients susceptible to moisture uptake and lipid oxidation.
- Qualitatively determine changes in food product attributes through sensory evaluation methods after storage in 3 different packaging films.
- Evaluate the potential of each packaging material based on qualitative and quantitative results.

用途
- 干麦片易于从吸收水分变差的质量。
- 棉籽油易因氧气而发生氧化。
- 坚果产生一种氧化标志，即六氢醛，可通过分析包装袋的气相来量化。

食品样选择
- 麦片
  - Tolas（AlOX涂层薄膜）
  - Technipaq薄膜
- 花生
  - Combitherm
- 棉籽油
  - Combitherm

Performance Rate Comparison
- The table below shows the oxygen transmission rate (OTR) and water vapor transmission rate (WVT) for each packaging material listed.
- Glass and aluminum have the best available barrier properties for food packaging purposes.
- Temperature and relative humidity may have an effect on the permeation rate of a packaging film.

Packaging Material Information

Combitherm Film
- Structure: Nylon/EVOH/Nylon/High Ethylene Vinyl Acetate Polyethylene/LLDPE
- PROS: Lightweight and transparent. Microwaveable and can be incinerated
- CONS: Requires an overwrap film due to poor barrier properties. Overwrap causes a major increase in mass for food system.

Technipaq Film
- Structure: A quadlaminate film. PET/Polylehtylene/Aluminum/Inomer
- PROS: Best barrier properties available in a film.
- CONS: Film cannot be incinerated or microwaved due to aluminum layer. Film is not clear to allow for food identification.

Tolas Film
- Structure: A PET film coated with a thin layer of aluminum oxide.
- PROS: Very lightweight with excellent barrier properties. Transparent film. Microwaveable and can be incinerated.
- CONS: Stress cracking caused by wrinkles during vacuum packing may reduce the barrier properties.

Food Sample Selection
- Dry cereal is prone to reduced quality from absorption of water vapor.
- Cottonseed oil is susceptible to lipid oxidation in the presence of oxygen.
- Peanuts produce a rancidity marker, hexanal, which can be quantified by analysis of the gas in the headspace of the package.
