Earth Science Mining Web Services

< Infusion of Diverse Technologies via Web Services >

Abstract To allow scientists further capabilities in the area of data mining and web services, the Goddard Earth Sciences Data and Information Services Center (GES DISC) and researchers at the University of Alabama in Huntsville (UAH) have developed a system to mine data at the source without the need of network transfers. The system has been constructed by linking together several pre-existing technologies: the Simple Scalable Script-based Science Processor for Measurements (S4PM), a processing engine at the GES DISC; the Algorithm Development and Mining (ADaM) system, a data mining toolkit from UAH that can be configured in a variety of ways to create customized mining processes; ActiveBPEL, a workflow execution engine based on BPEL (Business Process Execution Language); XBaya, a graphical workflow composer, and the EOS Clearinghouse (ECHO).

Web Services enables the infusion of diverse technologies

XBaya is used to construct an analysis workflow at UAH using ADaM components, which are also installed remotely at the GES DISC, wrapped as Web Services. The S4PM processing engine searches ECHO for data using space-time criteria, stashing them to cache, allowing the ActiveBPEL engine to remotely orchestrate the processing workflow within S4PM. As mining is completed, the output is placed in an FTP holding area for the end user. The goals are to give users control over the data they want to process, while mining data at the data source using the server's resources rather than transferring the full volume over the internet. These diverse technologies have been infused into a functioning, distributed system with only minor changes to the underlying technologies. The key to this infusion is the loosely coupled, Web-based architecture. All of the participating components are accessible (one way or another) through (Simple Object Access Protocol) SOAP-based Web Services.

Mining Web Services Architecture

ActiveBPEL // Remotely hosted Web Service orchestration

• Open source Java based implementation of the BPEL engine
• Reads WSDL file from XBaya
• Orchestrates processes from initial stage to execution
• Manages flow control, alarms and other executions

Conclusion

Earth Science Mining Web Services, created from an infusion of well-known technologies, have shown promising results to the data mining/scientific community. With an abundance of algorithms available, users can create and execute their data mining workflows without any data transfer. In turn this gives user control over the data they want to process at the server's source. The next phase will be the Smart Assistant for Earth Science Data Mining (SAM). SAM will provide data type/mining ontologies to aid in workflow composition, expansion of existing workflow composer tool and deployment of existing mining services in additional environments.
