**TRAINING DIRECTED RESEARCH PROJECT OVERVIEW**

Future space missions will be significantly longer than current shuttle missions and new systems will be more complex than current systems. Increasing communication delays between crews and Earth-based support means that astronauts need to be prepared to handle the unexpected on their own. As crews become more autonomous, their potential span of control and required expertise must grow to match their autonomy. It is not possible to train for every eventuality ahead of time on the ground, or to maintain trained skills across long intervals of disuse. To adequately prepare NASA personnel for these challenges, new training approaches, methodologies, and tools are required. This research project aims at developing these training capabilities. By researching established training principles, examining future needs, and by using current practices in space flight training as test beds, both in Flight Controller and Crew Medical domains, this research project is mitigating program risks and generating templates and requirements to meet future training needs.

Training efforts in Fiscal Year 08 (FY08) strongly focused on crew medical training, but also began exploring how Space Flight Resource Management training for Mission Operations Directorate (MOD) Flight Controllers could be integrated with systems training for optimal Mission Control Center (MCC) operations.

• Risk associated with reduced safety and efficiency due to poor human factors design
• Risk of error due to inadequate information

**Flight Controller Training**

Based on the understanding of MOD needs, constraints, and current practices, a conceptual framework for **Operationally Oriented Training** was developed.

This framework integrates research on adult learning principles, lessons learned in analog domains, and the results of multiple extensive discussions with MOD training and operations personnel.

To improve performance on Space Flight Resource Management (SFRM) skills, to enable early recognition of SFRM challenges, and to increase the overall effectiveness of Flight Controllers' training, our framework introduces SFRM early in the training flow, to integrate SFRM skills with the technical skills, and to provide continuous explicit guidance and feedback on SFRM performance throughout training and operations.

**Medical Training**

**Constellation Medical Training Needs Analysis**

In FY08, a Constellation medical training needs analysis was performed that examined the most current Constellation Crew Exploration Vehicle (CEV) Medical Operations group's Concept of Operations and identified expected space medical training needs according to the mission type. This report highlighted areas for further research. In addition to this report, five individual interviews were conducted with ISS long duration crewmembers regarding space medical training. From both of these activities, specific project related research has been developed and will continue into FY09 and beyond.

**Demonstration of JIT Training Technique**

This product consisted of an investigation and demonstration of just-in-time training techniques. Three components were delivered as a JIT training technique package: a general overview of JIT training, a survey of medical techniques that claim to be JIT training tools and their features and components, and a paper-based concept prototype for a Flight Surgeon’s real-time decision aid/JIT training concept for ISS emergencies.

**Exploratory Evaluation of JIT Training Tools for an Emergency Procedure**

A preliminary evaluation of JIT medical training on two display devices (a head-up display and a handheld PDA) was conducted in the last quarter of FY08. Baseline measurements were gathered (e.g. types of errors, scenario completion times) for planning an integrated evaluation, and assist with further development of prototype JIT training tools. This exploratory research provides a better understanding of performance times and types of errors associated with each media device, and will lead to an integrated evaluation using a prototype software tool in the first quarter of FY09.

**Trade Study of Analogue Environments to Conduct Studies for Training**

To understand crew performance under the expected conditions of future space flight missions, analogue environments must be used. To assess the value of such environments for evaluating training methods, a comparative study of space-analogue environments was conducted.

**FY08 Deliverables**

- **Trade Study of Analogue Environments to Conduct Distributed Team Studies**
- **Space Human Factors Engineering Training Directed Research Project**
- **Constellation Medical Training Needs Analysis**
- **SFRM Generic Training Framework Concept Prototype**
- **Demonstration of JIT Training Technique**
- **Space Human Factors Engineering Training Directed Research Project**
- **Flight Surgeon Decision Aid**
- **Space Human Factors Engineering Training Directed Research Project**
- **SFRM Generic Training Framework Concept Prototype**
- **Demonstration of JIT Training Technique**
- **Flight Surgeon Decision Aid**
- **Flight Surgeon Decision Aid**

**Future Research Direction**

**The Training Continuum**

- **Pre-Flight**
- **In-Flight Ops**
- **In-Flight Refresher**
- **In-Flight JITT**
- **Post Flight**

**Some Research Questions:**

- What are the basic and generalizable skills underlying different tasks?
- What is the optimal distribution of topics across training opportunities?
- What is the optimal delivery method and media for a given training topic?
- How do we assess proficiency?

**Stakeholders:**

Robert Banfield, Chief, Expedition Vehicle Division, JSC/DI
Dr. Joseph Schmid, Lead, Space Medicine Training,
Medical Operations, JCS/SD
