NASA / GE Aviation Collaborative Partnership Research in Ultra High Bypass Cycle Propulsion Concepts

Abstract

Current collaborative research with General Electric Aviation on Open Rotor propulsion as part of the Subsonic Fixed Wing Project Ultra High Bypass Engine Partnership Element is discussed. The Subsonic Fixed Wing Project goals are reviewed, as well as their relative technology level compared to previous NASA noise program goals. The current Open Rotor propulsion research activity at NASA and GE are discussed including the contributions each entity bring toward the research project, and technical plans and objectives. GE Open Rotor propulsion technology and business plans currently and toward the future are also discussed, including the role the NASA SFW UHB partnership plays toward achieving those goals.

Fundamental Aeronautics Program  
2nd Annual Meeting  
Atlanta, GA  
October 7-9, 2008
Objective

- Develop noise reduction, emission reduction and performance improvement technologies for the Ultra High Bypass engine cycle, then demonstrate and validate their potential in full scale applications

NASA has a strong and successful history of developing aircraft propulsion improvement technologies with Industry/OGA/Academia partners
Today, increasing fuel prices and tighter environmental regulations along with aggressive SFW goals for future aircraft requires refining, improving and demonstrating the combined effectiveness of previous noise reduction and performance enhancing technologies.

** An additional reduction of 10 percent may be possible through improved operational capability
* Concepts that enable optimal use of runways at multiple airports within the metropolitan areas

EIS = Entry Into Service, IOC = Initial Operating Capability

** N+1 Conventional **

** N+2 Hybrid Wing/Body **

** N+3 Generation **
However, limited goals trading is possible to address specific requirements.
Meeting SFW Goals Requires Evaluating Game-Changing Architectures

• Open Rotor Technology has potential for significant performance improvement, but with noise goal challenges
2008 Highlights

- Space Act Agreement signed August 2008 to initiate collaborative research into Open Rotor propulsion concepts

- NASA and GE will conduct cooperative research on initial Open Rotor concepts to determine noise and performance characteristics in NASA Glenn 9’x15’ and 8’x6’ wind tunnels starting in early 2009
Extensive 1980s collaborative testing experience of counter-rotation, open rotor concepts by NASA and GE, resulting in substantial experimental database to guide new activity

Improved Computational Aeroacoustics developed by NASA/GE/Universities to evaluate new open rotor concepts

Improved design and system analysis tools to screen potential candidates and minimize scale model test configurations

Utilize proven NASA test facilities, improved diagnostic testing techniques and existing scale model test articles

Build on GE expertise in composite construction and advanced core technology to achieve full Open Rotor potential
NASA / GE Partnership for the Open Rotor Test Program

**Test Objectives**

- Produce a shareable open-rotor design and geometry to use as technology baseline
- Investigate performance and noise including installation and AOA effects across a potential flight operating envelope
- Generate open, shareable database of test results as a Historical Baseline Open Rotor configuration to aid prediction code development and verification by Government/Industry/Academia

**Plan**

- NASA will refurbish, modernize and make operational 1980s counter-rotation Open Rotor Propulsion Rig
- GE will design and fabricate 1980s-based open rotor fan
- Low-speed performance, acoustics, flow diagnostics, AOA and installation effects will be investigated in NASA Glenn 9’x15’ LSWT
- High-speed performance and near-field acoustics will be investigated in NASA Glenn 8’x6’ SWT
NASA / GE Partnership for the Open Rotor Test Program

**NASA Glenn Open Rotor Propulsion Rig**

- Two independently controlled, counter-rotating shafts
- Each shaft capable of delivering up to 750 shp at maximum speed of 10,000 rpm
- Two-component rotating force balances measure up to 400 lbs thrust and 500 ft-lbs torque per rotor
- State-of-the-art digital telemetry units transmit data from each rotor to base system for transfer and storage on facility data system
- Up to 12 strain gages per rotor available for monitoring fan blade dynamics
- All subsystems (speed control, lubrication, air supply) are new, state-of-the-art designs

Future

• Through a NASA / GE partnership collaboration, both partners can leverage their experience, expertise, facilities and resources to conduct research on Open Rotor Propulsion concepts for the next generation of advanced aircraft designs and investigate their viability as a new, game-changing aircraft propulsion technology in a environmentally-conscious world.

10% better fuel burn potential ... with challenges

- Noise
- Maintenance
- Installation

EPNdB - Margin to Stage 4

% Improved fuel burn
Open Rotor Technology Challenges

- **Noise**
  - Current acoustic goal of Stage 4 – 10 dB for configuration to get balanced solution for noise/fuel burn

- **Maintenance**
  - Costs need to be inline with current generation of turbofans

- **Installation**
  - Large effective fan diameter requires careful integration with airframe

- **Overall**
  - Determine best solution meeting noise, fuel burn, maintenance and weight constraints
Leveraging the UDF® Experience

- Ground and flight tests in 1987 & ’88
  … featured at Farnborough Air Show 1988
- Demonstrated tremendous potential for fuel burn improvement

GE Aviation
Open Rotor Aeroacoustics

- Computation Aeroacoustics (CAA) is being used to guide design studies
  - Developed by NASA, Industry and Academia

- CAA tools allow fewer test configurations and better understanding of noise generation mechanisms

- Scale model hardware defined with new tools
Leveraging Testing Experience at NASA

- NASA ran aeroacoustic and performance testing at GRC as part of collaborative technology development in 1980’s
- Acoustic test execution and data acquisition expertise to support development
- Utilize NASA’s advanced measurement techniques as needed to understand flow physics and noise generation
- Test data to validate and enhance prediction processes
Open rotor scale model test program

- Validate analytical codes
- Evaluate pylon and fuselage interactions

- Low-Speed (NASA 9x15 wind tunnel)
  - Far-field acoustics
  - Aero performance
  - Diagnostic measurements
  - Installed configurations

- High Speed (NASA 8x6 wind tunnel)
  - Aero performance
  - Limited near-field acoustics
• “Golden Data Set” – comprehensive, representative baseline blade test results (isolated and installed)
  – Acoustic database
  – Performance data
  – Blade geometry for CFD analysis – New!

• Multiple blade designs to validate codes/explore design space

• Back to back isolated and installed testing for incremental analysis

• Demonstration of acoustic benefits with best performance using advanced diagnostics
How we will get there ...
