Neuromuscular Adaptations to Reduced Use

Lori Ploutz-Snyder, Ph.D
Disuse Models

- Outcomes are dependent on specifics of disuse model and species used.

Certain dormant species display no muscle atrophy, despite months of disuse

- *Ursus americanus*
  - Minimal atrophy following 4-months disuse

- *Cyclorana alboguttata*
  - No loss of muscle mass, in vitro force production or swimming performance following 9-months aestivation

- *Cynomys leucurus*
  - Maintenance of slow MHC isoforms

Hudson & Franklin, J Exp Biol, 2002
Hudson & Franklin, J Comp Physiol, 2002
Rourke et al, 2006
Between species differences is related to mass-specific metabolic rate

- Low metabolic rate (normalized to muscle mass) = Less Atrophy
  - $R^2 = 0.76$

- Hypotheses:
  1. Lower metabolic rate species are less active… thus disuse is a smaller stimulus
  2. Low-metabolic rate species would have lesser reactive oxygen species (ROS) insult
So what about that tiny frog???

- Pre-dormancy & Dormancy: Metabolic rate is drastically reduced
  - Thus, the demands placed on the muscular defense (antioxidants) and repair (de novo protein synthesis) systems are alleviated, and the rate of atrophy are reduced accordingly.
Human Muscle Unloaded With ULLS

Sensitivity: 97.7%
Specificity: 96.5%

(Cook et al. *Aviat. Space Env Med* 2005)
3 sets of ULLS studies

- Early 1990’s - more muscle required to lift same absolute load following 30 day ULLS
- 2005-06 - Neural vs. muscle morphologic changes with ULLS
- 2006-08 - Low load exercise countermeasure
Muscle Strength Decreases More Than Mass

Combined data from: Adams et al., Berg et al., Hather et al., and Ploutz-Snyder et al.
Neural & Contractile Control of Force

Adapted from Duchateau and Enoka,
Muscle Strength Decreases More Than Muscle Size

Combined data from: Adams et al., Berg et al., Hather et al., and Ploutz-Snyder et al.
Schema modified from Bigland-Ritchie
Neural vs. Morphologic Factors

- What neural factors are altered?
- What muscle factors are altered?
- What is the relative contribution of each?
Perturbations

- Neural
  - Mental imagery
- Muscular
  - Ischemia
Immobilization Decreases Cortical Excitability

Kaneko, Murakami et al., Clin Neurophys, 2003
Motor Imagery Activates Same Neural Structures as Motor Performance

Red Pixels: Significant fMRI signal increases during both actual MP and MI

Porro, Francescato et al., *J. Neurosci*, 1996
Motor Imagery Training
↑ Strength & EEG Activity

Ranganathan, Siemionow et al., *Neuropsych.*, 2004
Chronic Ischemia in Rats:
↑ HSP-72, ↓ Myostatin & ↑ Myofiber CSA

50% Atrophy Attenuation Following Surgically-Induced Bed Rest

• 18 subjects
  – 6 men & 12 women
  – 18-29 years

• ULLS + No Intervention (n=6)

• ULLS + Ischemia (n=6)
  – 3x/wk

• ULLS + Motor Imagery (n=6)
  – 4x/wk
Spinal Excitability ↑ w/ Motor Imagery

Large Variability In Atrophy With Unloading

Muscle Action Potential Duration

Slowed Muscle Fiber Conduction Velocity  
(Keenan, Farina et al., Exp Brain Research, 2006)

Control Groups

Applied Ischemia Group

Physiologic Interpretation

• Maintenance of potentiated force, despite ↓ doublet force
  – Common Interpretation: Phosphorylation of Myosin Light Chains increasing Ca$^{2+}$ sensitivity?
  – Shift towards Type II muscle fiber type composition?
    (Sweeney, Bowman et al. Am J Physiol, 1993)
Central Activation

Limitations

- **Sample Size**
  - 2\textsuperscript{nd} largest to date, but still relatively small

- **Unaccounted for variables**
  - Skeletal Muscle Pennation Angle
  - Skeletal Muscle Fiber Type
  - Cortical Excitability
  - Motor Unit Discharge Rate
Exercise Countermeasure

- Ischemia alone maintained only CMAP duration
- Ischemia + low load exercise
- Japanese kaatsu
- Potential for rehab or situations where heavy loading is undesirable.
Countermeasures to unloading

• High-load resistance training has maintained muscle mass and strength during unloading.

• Low-load resistance training with a blood flow restriction (LL_{BFR}) has been shown to increase muscle mass and strength.
  (Shinohara et al. 1998, Takarada et al. 2000, Burgomaster et al. 2003)
Recent Interest in Tourniquet Training

• Kaatsu - Japanese
  – Japan Kaatsu Training Society
  – *International Journal of Kaatsu Training* - their own journal, unclear review process.
  – Inventor/Owner=Yoshiaki Sato, Department of Ischemic Circulatory Physiology
  – Body building websites
    • Testosterone Nation
    • Giant
    • Cutting Edge Muscle
加圧トレーニング
腕や太ももの付け根に近いところをバンドで締めて圧迫し、軽い運動をするだけで筋肉が増える（専門家の指導が必要）

Brooks, Fahey and Baldwin 2005
Low Load With Blood Flow Restriction $L_{\text{BFR}}$
Growth Hormone Response to Acute \( \text{LL}_{\text{BFR}} \) Exercise

GH increased 290 times baseline!!

Growth Hormone Response to Acute LL_{BFR} Exercise

~8-fold increase but not 290!

Pierce et al. J. Appl. Physiol. 2006
Possible mechanisms of hypertrophy via $LL_{BFR}$

- **Greater reliance on anaerobic metabolism**  

- **Increased angiogenesis during hypoxia**  

- **Altered motor unit recruitment patterns**  

- **Increased levels of growth hormone**  

- **Mechanical signaling of muscle cell**
Methods

16 subjects aged 18-50 yrs

- 8 subjects performed unilateral lower limb suspension (ULLS)
- 8 subjects performed ULLS and LL_{BFR} exercise on the KE 3 times per week (ULLS + Exercise)
**LL\textsubscript{BFR} Exercise**

- Performed 3x per week
- 3 sets of KE to volitional failure
  - 20% MVC
  - 2-sec con, 2-sec ecc
  - 90 sec rest between sets
- 6 x 83 cm tourniquet cuff around proximal thigh
  - Inflated to 1.3 x SBP for the duration of exercise session
- 100% subject compliance

Average of Control Period vs Post ULLS

24% increase
28% decrease
Conclusion

- Performing $\text{LL}_{\text{BFR}} \text{ KE}$ exercise during 30d of unloading can maintain muscle size and strength of the KE and even improve muscular endurance.
