Office of the Technical Assistant in Europe
2, Avenue Gabriel

Paris

April 4, 1935.

To: National Advisory Committee for Aeronautics, Washington, D. C.

Subject: Notes on New French Commercial Airplanes.

The new airplanes ordered for Air France, the Wibault 670 18-passenger low-wing monoplane and the Potez 620 14-passenger high-wing monoplane, are now under test at Villacoublay.

Air France has ordered one example of the Wibault and six of the Potez. The latter is merely a "civilized" version of the type 54 multiplace fighter (of which 135 examples have been ordered by the Air Ministry) but with two 820 horsepower 14 Krbd Gnome-Rhone engines instead of two 690 horsepower 12 Xbrs Hispano. The particular Gnome-Rhone engines used are the semisupercharged type develop-
ing their rated power at 2,160 m (7,152 ft.), but giving 1,065 horsepower for take-off purposes at sea level.

The Wibault 670 is a modern transport airplane naturally strongly reminiscent of Douglas practice while bearing a family likeness to the Wibault 283. The power plant is the same as that of the Potez 620.

Mr. Wibault's factory is still at Courbevoie but within a month it is to be transferred to the Brégoust factory at Villacoublay-Vélizy.

Mr. Wibault showed me the plans of a 46-passenger low-wing monoplane which he designed in June 1934, but which has not yet been ordered. The power plant would consist of four Gnome-Rhone 14 Xrrsd engines well forward of the leading edge and giving the calculated top speed of 250 mi./hr. From the passengers' viewpoint, an interesting feature of this airplane is the large lounge and bar placed at the center of gravity of the airplane. Mr. Wibault likewise pointed out that the height of the various cabins would be not less than 8 feet.

Now approaching completion are four 30-seat low-wing monoplanes which will be added to the fleet of Air France late this year. These are the Dewoitine 620 and the Bloch 300, each with three Gnome-Rhone 14 Xrrsd engines. One example of each make is being paid for by Air France and the
other by the Air Ministry. The government-owned airplanes will be assigned to Air France by a hire-purchase agreement.

On a visit to the small Bloch factory at Courbevoie I inspected the fuselage and wings of the type 300, the first example of which should be completed by the end of May.

Other aircraft recently delivered to Air France or shortly to be placed in service and too well known to warrant description, are the following:

**Airplanes**

3 Dewoitine D.333 (3 575 hp. Hispano Cyclone)*
6 Bréguet 393 (3 350 hp. Gnome-Rhone 7 Kds)
17 Wibault 283 (3 350 hp. Gnome-Rhone 7 Kds)

**Seaplanes**

2 Lioré and Olivier E 242 (4 350 hp. Gnome-Rhone 7 Kd)
2 Bréguet-Short "Saigon" (3 785 hp. Hispano 12 Ybr)

*Total weight, 9,956 kg (21,949.2 lb.); maximum speed, 287 km/h (178.3 mi./hr.); cruising speed at 2/3 power, 237 km/h (147.3 mi./hr.); load factor, 7.
Wibault 670 (2 Gnome-Rhone 14 Krsd)

Mr. Wibault has built only one example of this type which is now under test at Villacoublay. It is a low-wing monoplane, following in general the Douglas formula, but with certain distinctive Wibault characteristics. As seen from the general-arrangement plans and photographs (figs. 1, 2, 3, and 4), the engine nacelles project well above the upper wing surface for their entire length in order to house properly the electrically operated Breguet retractable landing gear.

The wing structure comprises two duralumin spars. Slotted ailerons divided into two sections on each side extend over almost the entire span, the outer sections being used for lateral control and the inner sections being lowered by an electric motor to reduce the landing speed by changing the angle of incidence of the wing.

The stabilizer is adjustable about its forward spar, the pilot changing the angle by means of a cable running from a wheel to a drum at the tail connected with a worm gear driving a couple of eccentrics. In addition, the elevators and rudder have Flettner flaps adjustable in flight.

Behind the pilots' seats is the radio operators' station which in turn is followed by the cabin for 18 passengers each of whom has his own window.
The soundproofing of the airplane has been entrusted to Mr. S. J. Zand, of the Sperry Company.

Potez 620 (2 Gnome-Rhone 14 Krad)

This airplane (figs. 5 and 6), the first of six ordered by Air France, is now undergoing test flights at Villacoublay. It is merely a modification of the Potez 54 multiplace fighter and is really an interim design intended to meet the competition of foreign companies as regards performance pending the production of airplanes of really modern design.

The wings are of duralumin covered with fabric and the fuselage is of wood. The cabin accommodates 14 passengers.

The landing wheels retract into the engine nacelles which are slung well below the braced high wing.

Characteristics of Wibault 670 and Potez 620 Airplanes

Required performances:

- Cruising speed at 62\% percent power at 1500 m (4920 ft.):
  - 275.0 km/h (170.9 mi./hr.)
  - 265.0 km/h (164.7 mi./hr.)
- Range with above pay load:
  - 1000.0 km (621.4 mi.)
  - 1000.0 km (621.4 mi.)

Note on Wibault.—For 2,000 km (1,242.7 mi.) range, 2,227 kg (4,909.7 lb.) fuel carried, reducing pay load to 920 kg (2,028.3 lb.) (8 passengers and luggage and 200 kg (440.9 lb.) freight).
Note on Potez.—Preliminary tests at Villacoublay give a maximum speed of 325 km/h (201.9 mi./hr.) at 1,500 m (4,921 ft.). Above cruising speed therefore should be exceeded. Makers claim a cruising speed of 280 km/h (174 mi./hr.), a ceiling of 7,500 m (24,606 ft.) (4,900 m (13,123 ft.) on one engine) and speed of 200 km/h (124.3 mi./hr.) on one engine.

Dewoitine D. 620 (3 820 hp. Gnome-Rhone 14 Krsd)

The first of the two 30-seat Dewoitine monoplanes is nearly finished at the Toulouse factory and will be delivered to the Service Technique early this summer. The airplane follows usual Dewoitine practice in having a single spar.

The smooth wing covering is of Vedal and there are split flaps at the trailing edge.

The fuselage is of monocoque structure made up of longerons, formers, and stringers. It is divided into two parts:

A. Nose freight compartment
   Pilots' compartment
   Radio station
   Luggage compartment
   Cabin for 9 passengers (3 abreast)

B. Cabin for 21 passengers (3 abreast)
   Bar
   Lavatory
   Second luggage compartment

Chrome-molybdenum steel is used for engine mounts and landing gear. The latter, of the retractable type, is operated by compressed air and has Messier oleo-pneumatic
shock absorbers.

The metal tail surfaces include an adjustable stabilizer.

The four gasoline tanks have a total capacity of 2,400 liters (634 gallons) and are equipped with dump valves. Behind each engine is an oil tank containing 30 liters (7.925 gallons).

The three-blade propellers will probably be of the new Gnome-Rhone infinitely variable controllable pitch type.

General-arrangement plans (fig. 7) and cabin plans (fig. 8) are attached as well as the characteristics and detailed estimated performances.

Bloch 300 (3 820 hp. Gnome-Rhone 14 Krsb)

The first of these two 30-seat monoplanes is approaching completion and should be delivered to Villacoublay by the end of May. The attached general-arrangement plans (fig. 9) show the design. The wing construction with one main and one subsidiary spar follows the simple methods hitherto adopted by marcel Bloch, altered however to permit smooth wing plating instead of with the longitudinal extruded T-section stiffeners characteristic of type 200.

The fuselage is built up of Vedal (Alclad) with close-
ly spaced internal longitudinal and transverse channel section stiffeners, to which the covering is riveted. As a safeguard against buckling there is a steel gusset plate at each intersection. The fuselage contains two principal cabins with seats arranged four abreast. At the demand of the Air Ministry the windows are large enough for exit, the glass panels being readily unshipped.

At the back of the rear cabin are two doors on each side.

The landing wheels retract forward into the wing engine nacelles which do not project above the upper wing surface. The split flaps are hydraulically operated. There is a Flettner control of the rudder and the stabilizer is adjustable.
