

# **NASA GPM GV Science Implementation**

Walter A. Petersen, NASA GPM GV Science Manager, NASA MSFC

- **Overview: Concept and Approaches**
- **Implementation**
  - **Direct Validation**
  - **Physical Validation**
  - **Integrated Validation**
  - **International Collaboration**

walt.petersen@nasa.gov

W. Petersen, International GPM Planning Meeting, Paris France, 16-18 June 2009

# GPM Ground Validation(GV) Overview

Pre-launch algorithm development & post-launch product evaluation

The GPM GV paradigm moves *beyond traditional direct validation/comparison* activities by *incorporating improved algorithm physics & model applications (end-to-end validation)* in the validation process.

**Three approaches:**

- **National Network (surface):**

*Operational networks to identify and resolve first order discrepancies (e.g., bias) between satellite and ground-based precipitation estimates*

- **Physical Process (vertical column):**

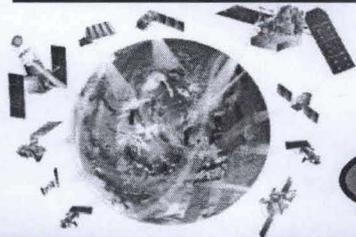

*Cloud system and microphysical studies geared toward testing and refinement of physically-based retrieval algorithms*

- **Integrated (4-dimensional):**

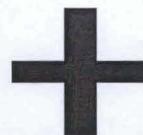

*Integration of satellite precipitation products into coupled prediction models to evaluate strengths/limitations of satellite precipitation products*

# GV Science: A System of Feedback

## Measurement

## Algorithms

## Products

DPR

GMI

## Validation

### National Networks

- Broad statistical evaluation
  - DPR Reflectivity
  - DPR/GMI Rain rate

### Physical Process

- Algorithm Physics:
  - Development
  - Refinement

### Integrated GV

- Application
  - Water Budget
  - NWP
  - Surface Hydrology

## Supporting Tools

### Radar/Rain Gauge Networks

- Reflectivity stats
- Rain rate stats

### Disdrometer Arrays

- DSD variability
- Rain rate stats
- GV Radar Cal/Val.
  - Z, D<sub>0</sub>

### Dual-Pol Radar, Wind Profiler

- Z, Rainfall mapping
- DSD Profile, Particle types
- CRM/LSM Physics/Profiles
- PIA
- Ice physics

### Aircraft

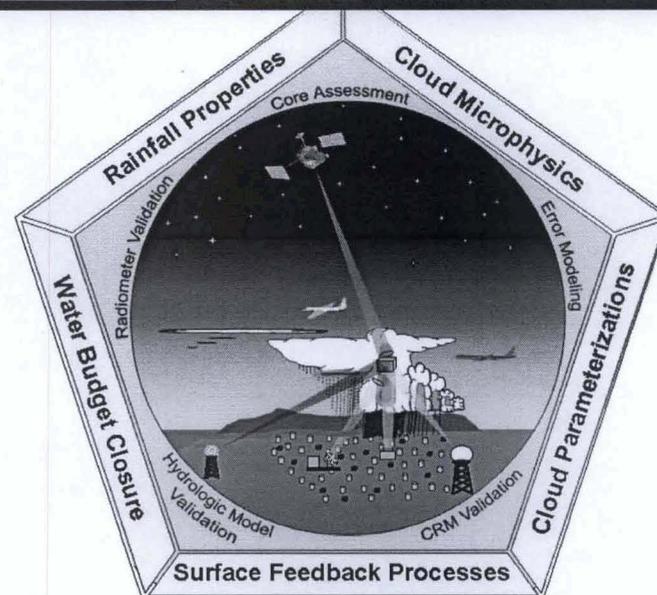

- Ice physics, melting layer
- Cloud water
- CRM/LSM Physics/Profiles
- GPM simulator
  - PIA, TBs

# Cross-cutting themes

## GPM GV

3 approaches support  
5 cross-cutting science themes:

1. Core satellite error characterization
2. Constellation satellites validation
3. Development of physical models of snow, cloud water, and mixed phase
4. Development of CRM and land-surface models to bridge observations and algorithms
5. Development of coupled CRM-land surface modeling for basin-scale water budget studies and natural hazard predictions

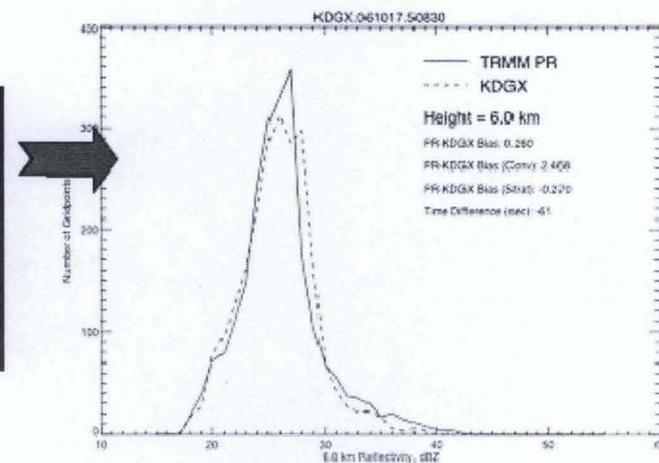

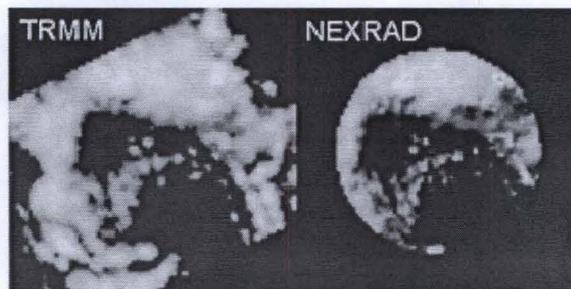

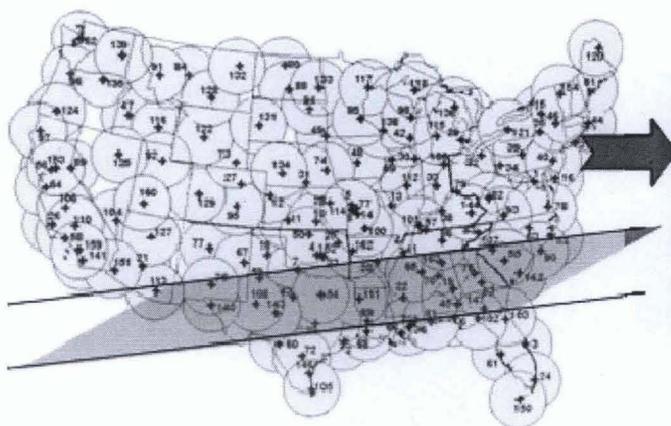

# Direct Validation: Validation Network (VN) Architecture

Identify systematic regional or regime issues using a two-tiered approach

## Tier 1): DPR Reflectivity- Ground Radar Validation Network (VN)

Reflectivity measurements/profiles of core satellite are *fundamental* to the entire GPM constellation (i.e. DPR serves as a GMI “calibrator”)

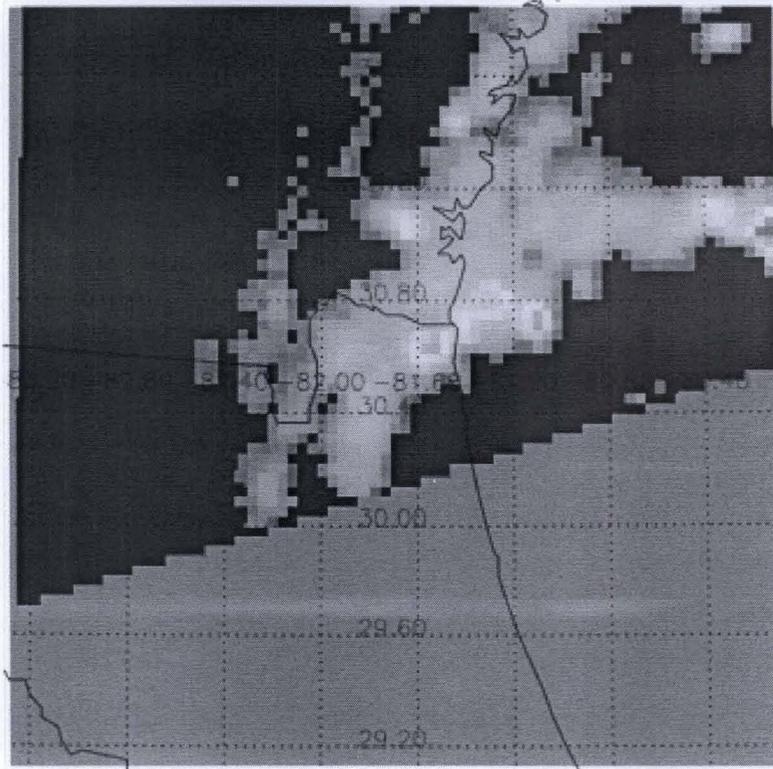

- Systematic regime variability in  $Z_{GPM} - Z_{Ground}$  can be detected with existing operational radars
- Stable calibration of DPR can also support calibration trending of ground sources
- Future dual-pol radar upgrades (U.S. and elsewhere) will facilitate broad area DSD statistics (D0) to be added- subsequently permits broad scale linking of DSD variability to Z.

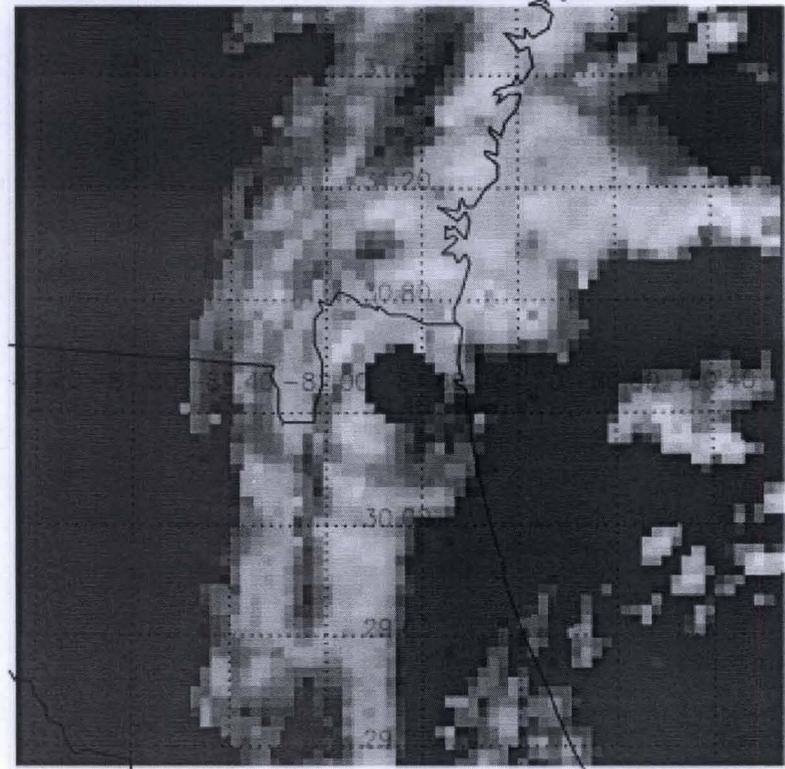

# Direct Validation: VN Reflectivity Comparison Methodology

Jacksonville, FL - 31 August 2007 - 6 km AGL

PR Attenuation-Corrected Reflectivity

KJAX WSR-88D Reflectivity

Create TRMM PR and Ground Radar Collocated Linked-Database

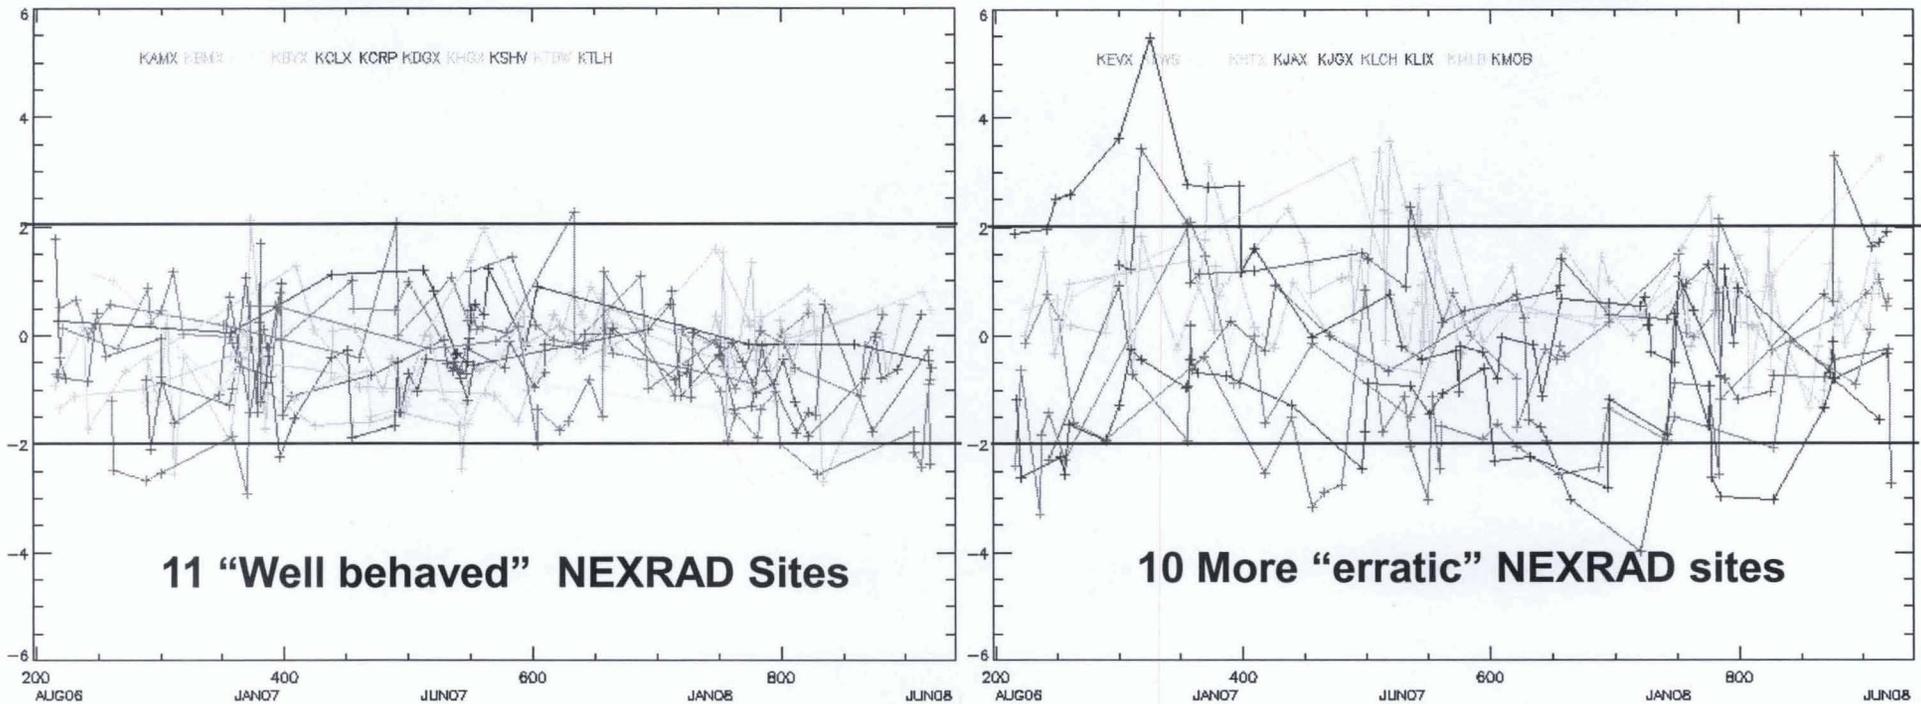

GV radar located at central grid point

4 km horizontal resolution, 75 x 75 elements, 300 x 300 km area

13 vertical slices from 1.5 km - 19.5 km, 1.5 km vertical resolution

period of record: August 8, 2006 to present

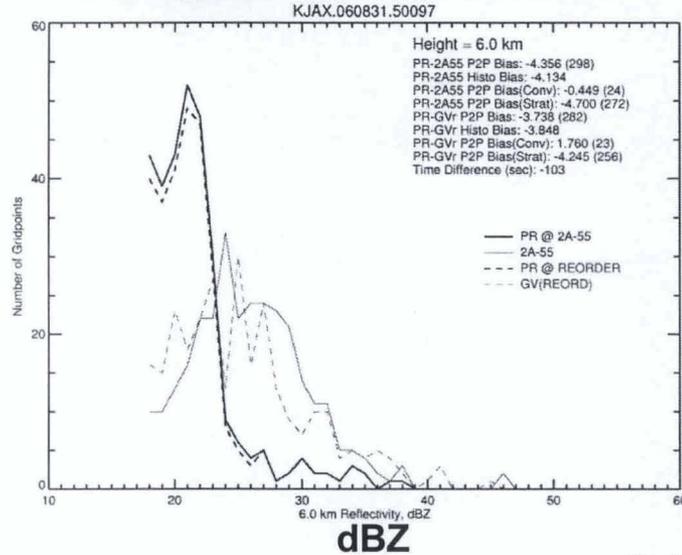

## Example of Reflectivity Comparisons

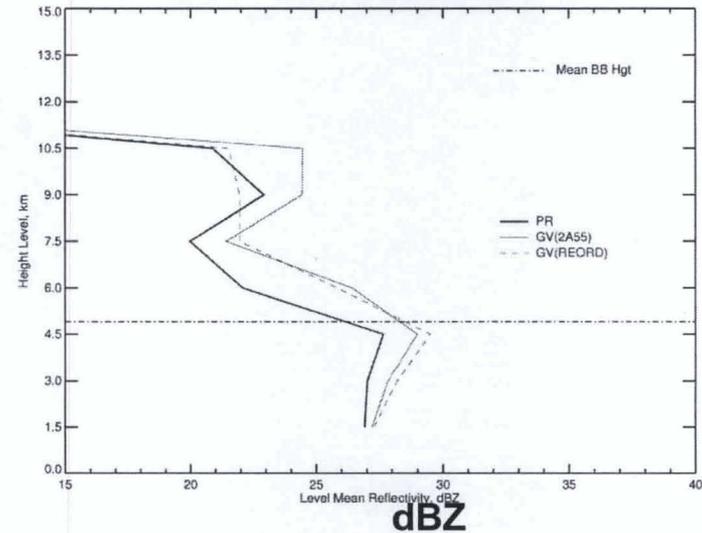

- **Well-behaved sites (left) have average reflectivity differences (PR-NEXRAD) between about  $\pm 2$  dBZ**
  - samples taken from *above* the bright band, within a 100 km radius of the ground radar, stratiform rain cases only
  - Enables establishment of gross ground radar bias/error behavior
  - Selection of well-behaved radars forms means to evaluate space borne platform (and also enables calibration correction of ground radars).

# Output Graphical Comparisons

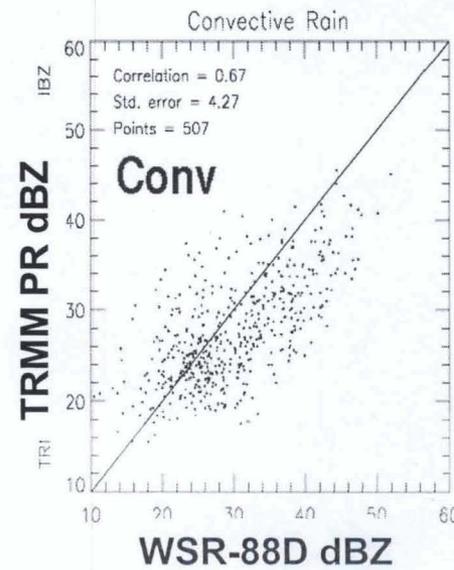

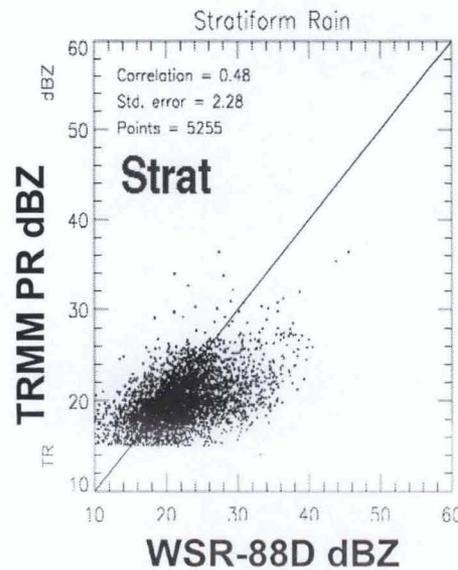

## Histogram Comparisons

## Vertical Profiles

## Scatter Plots By Precipitation Type

## Expanded Number of Global Contributing Sites

- **21 WSR-88D sites in the southeast US**
  - Raw data acquired from the NOAA Level-2 archive
  - Automated quality control (TRMM 2A-55 GV algorithms)
- **Also used for individual research radars**
  - NSSTC/UAH ARMOR Dual polarimetric C-band radar, 1-degree beamwidth
  - Kwajalein Atoll: Historical and on-going QC'd dataset from TRMM GV
  - Automated quality control using polarimetric methods
- **International Network Radars**
  - **Korea (KMA, METRI)**
    - Network of 18 S- and C-band radars
    - Automated quality control
    - Option to add additional sites
  - **Darwin (Australia)**
    - C/S band operational network
    - C-band, research dual polarization radar
- **Discussions underway with other international partners**

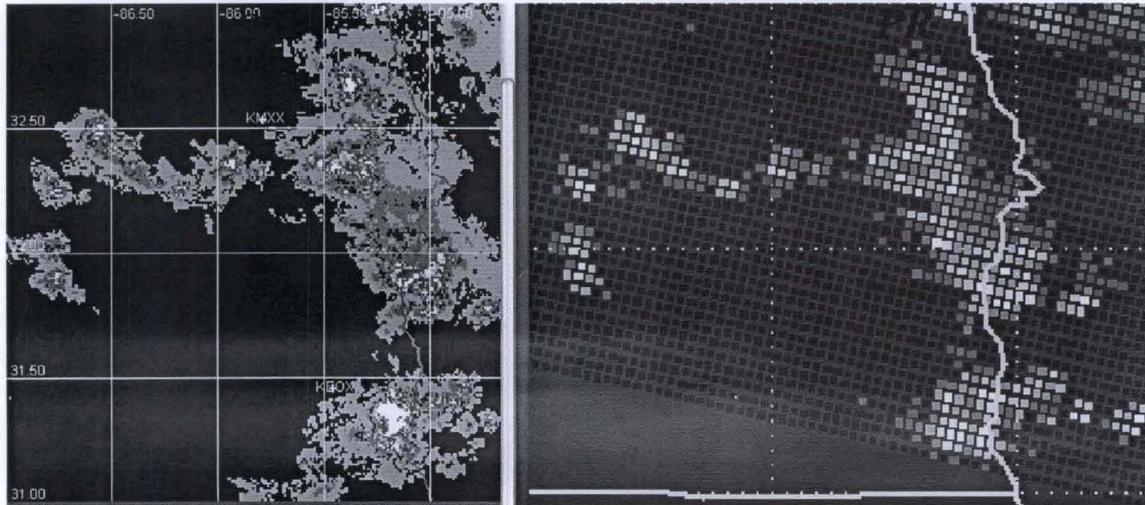

# National Network: Direct Validation of Rain Rates

## Tier 2): DPR/GMI Rain rates: NOAA Q2 Gridded Product (U.S. NEXRAD Network)

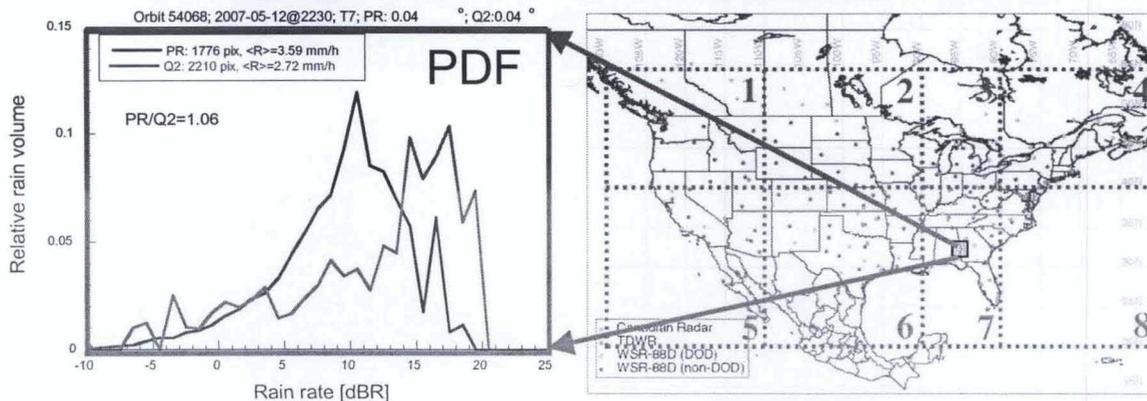

May 12, 2007 @ 22:30 UT

NOAA

TRMM

- NOAA Q2 National gridded merged radar-gauge product
- Evaluate GPM Constellation rain rate PDFs against Q2.
- Incorporation of other assets as appropriate (gauge networks, snowfall, Kwajalein GV etc.) into VN architecture

Courtesy: E. Amitai et al., (George Mason University)

# Physical Process Validation: Numerous Algorithm Issues/Needs

## Dual Frequency Precipitation Radar

### Detection:

Light rain, snow

Rain type (convective/stratiform)

### Attenuation:

PIA Algorithm: Errors/Accuracy

Assessing and/or accounting for impacts of CLW, water vapor, DSD and assumed DSD models

### Algorithm Physics:

DSD retrieval:

DFR algorithm and DSD model for 3-D retrieval of rain and snow as f(regimes, temporal / spatial variability, precipitation rate)

Z-R at light rain rates

Sub-pixel variability

Impact of external a priori regime ID

Melting level ID, variability, extinction

Hydrometeor ID and profile

## Passive Microwave Radiometer

### Detection:

Snowfall detection thresholds and surface/atmospheric emission characteristics

Rain no rain (especially light rain)

Rain type (convective/stratiform)

### Algorithm Physics:

Single/bulk ice scattering vs. precipitation rates, types

Melting layer extinction

Water vapor, cloud water, and mixed phase impacts/models

Impacts of a priori "regime" ID

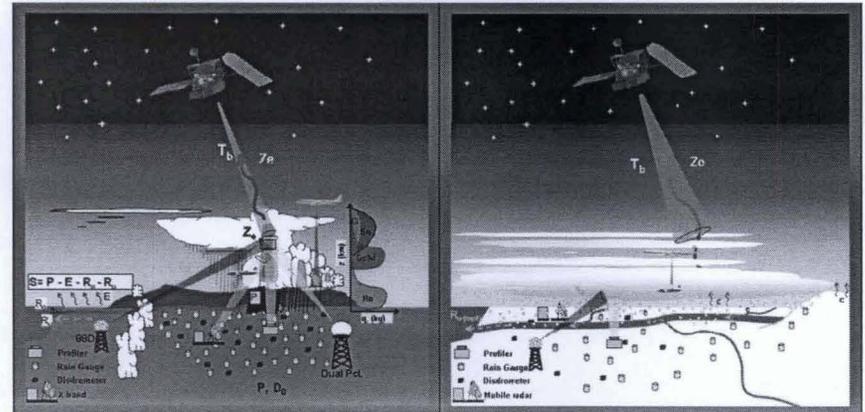

### Models:

"Synthetic nature" of Cloud profile databases; empirical vs. numerical

Coupled CRM/LSM physical inputs and associated parameterizations

# Implementation of Physical Process Validation: Field Campaigns

- **Designed for:**
  - Pre-launch physical algorithm development, post-launch product validation
  - Study of 3-D precipitation process/physics as a function of regime (**land emphasis**)
  - Improved coupling of Cloud/Radiative Transfer models for satellite simulator
- **Algorithm developers explicitly involved in planning, execution and analysis**
- **Intensive Observations and Extended Observations Programs (IOP, EOP)**
  - 5 Field Campaigns
  - Extended data collections to supplement existing operational infrastructure
  - Kwajalein Atoll: PMM-funded (current)
  - “Target of opportunity” IOP/EOP participation when justified and budget permits.
- **Completed Winter 2006-2007**
  - Canadian CloudSat Calipso Validation Project (C3VP): Canada/U.S. CloudSat/GPM; Initiate priority pre-launch snowfall measurements. Analysis ongoing (WG Talk today)
  - Next up: LPVEX- Finland, Sept-Oct. 2010; Low-level melting layers, snow

## *Field Campaign Implementation Planning*

| Objective   | Date                     | Partnership/Location  |
|---|--------------------------|---|
| <b>MC3E:</b> GMI/DPR rainfall retrievals over land surfaces                       | Spring/early summer 2011 | Mid-Latitude Continental Convective Clouds Experiment (MC3E)- DOE ARM SGP S. Central Oklahoma |
| <b>Cold-season</b> retrieval of frozen and mixed precipitation over land surfaces | Winter 2011/2012         | TBD   |
| <b>Physical/Integrated</b>  | 2013                     | NOAA Hydrometeorological Testbed, Tar/Neuse River Basin, N. Carolina                          |
| <b>Cold season</b> product validation   | 2015                     | TBD   |
| <b>Physical/Integrated</b>  | 2016                     | TBD   |

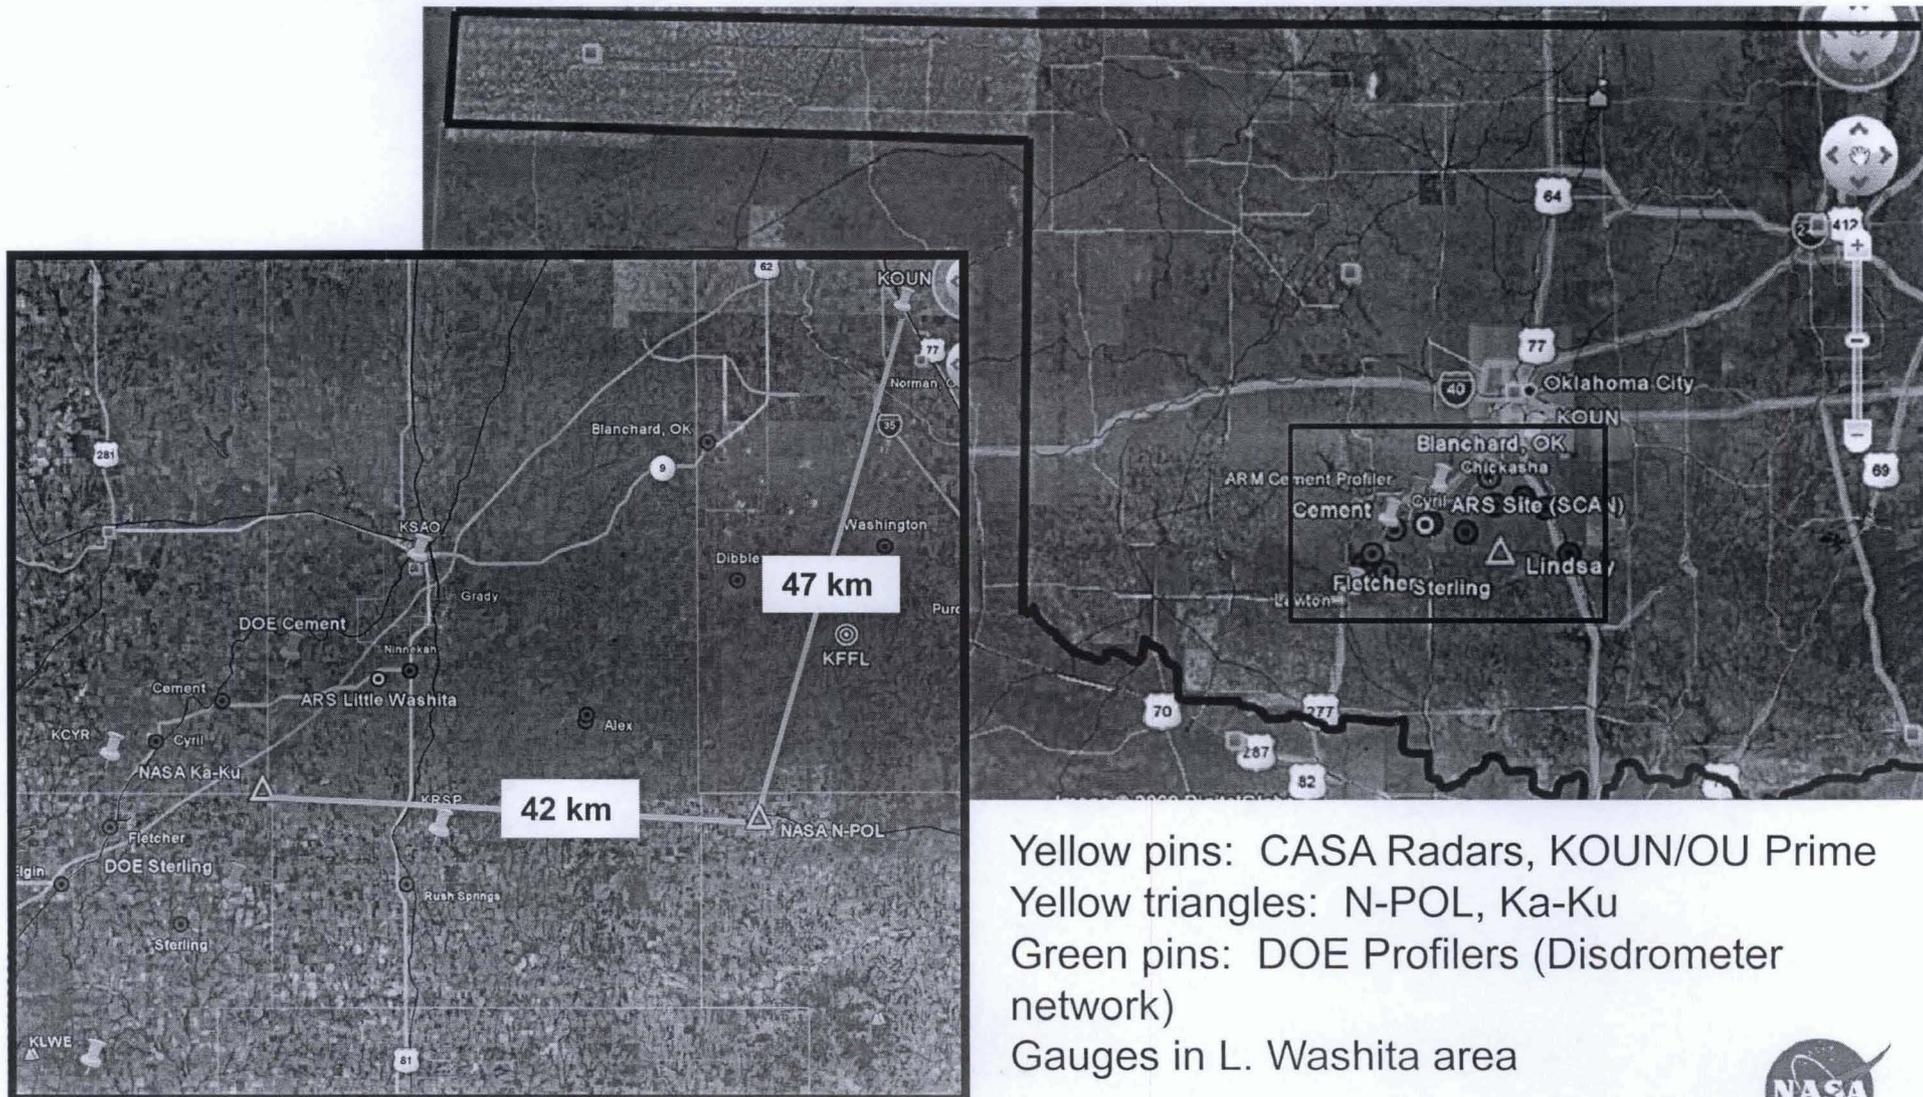

- **Upcoming International FC Collaborations**

- **Finland (Fall 2010):** Baltic Sea region, **mixed phase/low bright band precipitation.** Collaboration with CloudSat, Finland, ESA [Aircraft + Helsinki Testbed]
- **Canada (winter 2012):** Cold Season, CARE Site near Great Lakes, Ontario, Canada

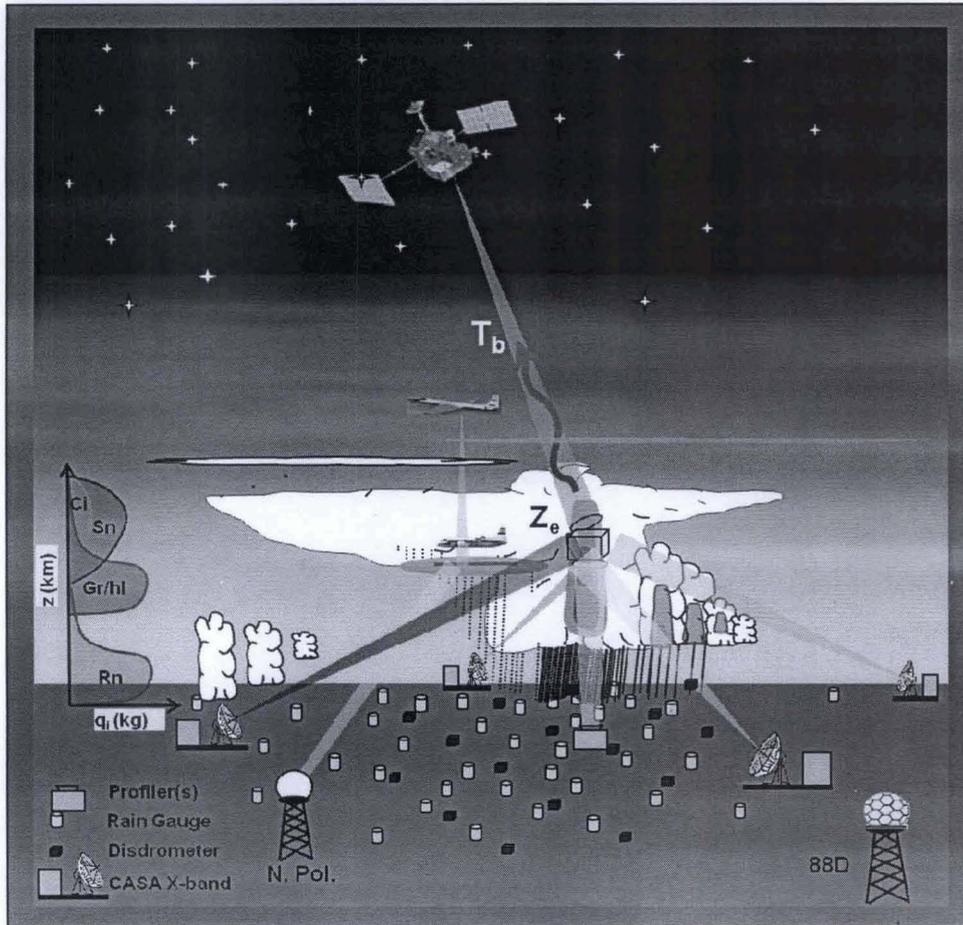

# GPM 2011 Continental Field Campaign (NASA/DOE) Mid-Latitude Continental Clouds and Convection Experiment (MC3E)

**Target Location/Date:** S. Central Oklahoma, April-June 2011 (TRMM Coverage)

**Targeted regimes:** Land, late spring transition (baroclinic, MCS, convection)

# GPM Priorities for Sampling

## Planned Instruments :

- Aircraft: ER-2 GPM simulator, microphysics
- Radars: NASA N-POL, NASA Ka-Ku, CASA X-band, ARM Ka/W, wind profilers
- Surface: Disdrometer/rain gauge network; soil moisture/fluxes/hydrologic
- Soundings: DOE SGP array 6 – 8 launches/day

1. DPR/GMI **simulator** observations
  - a. Most likely target- stratiform with ER-2 sample of convection
  - b. Microphysics AC legs at various depths and within melting layer
  - c. Pre and post storm sampling of surface backscatter cross-section
2. 3-D **Particle type/size variability**:
  - a. High density 2DVD measurements
  - b. Collocated multi-frequency and polarimetric radar (4-D extension)
  - c. Collocated/coincident with aircraft
3. Satellite **simulator CRM/LSM/RTM** Development:
  - a. Sounding data sets
  - b. Datasets 1, 2 above
  - c. Multi-Doppler kinematics

# **Physical Process Studies: Infrastructure Development**

## **Calibrated measurements across the full spectrum of precipitation rates/types**

### ***Ka/Ku-Band Transportable Scanning Dual-Polarimetric Radar***

- Match DPR frequencies, more direct link to PIA and dual-wavelength methods
- Extension to clouds, light precipitation, and improved sampling of ice, snow, mixed phase
- Mobility enables placement in variety of network configurations/regimes with relative ease

### ***N-POL S-band Transportable Scanning Dual-Polarimetric Radar***

- Transportable radar platform for study of heavy/moderate precipitation regimes
- Retrieval of 3-D particle size distribution (DSD) information and qualitative ice microphysics
- Receiver and antenna system upgrade ongoing; deployment summer 2010.

### ***Disdrometer/Gauge D-Scale Array (O[2-4 km separation over 100 km<sup>2</sup>])***

- Validation of GV ground radar DSD retrievals/precipitation rates and type
- Spatial/temporal covariance of particle size distributions and precipitation rates

### ***Wind Profiler***

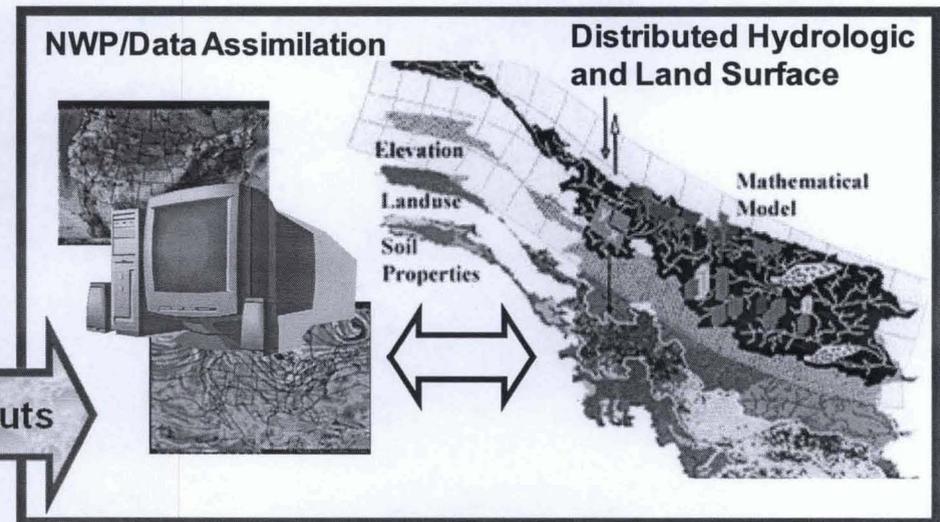

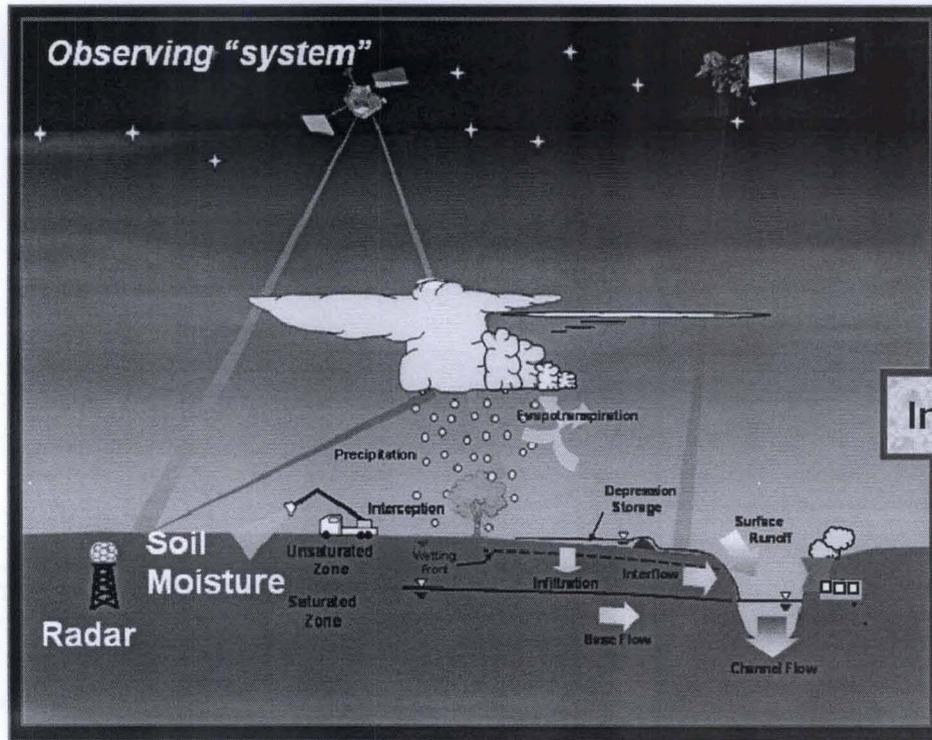

- Vertical profiles of Z, DSD under coverage umbrella of radar

### ***Aircraft Instrumentation/Operations***

- In situ cloud microphysical sampling
- High-altitude GPM (DPR/GMI) Simulator (HIWRAP, AMPR, COSMIR etc.)

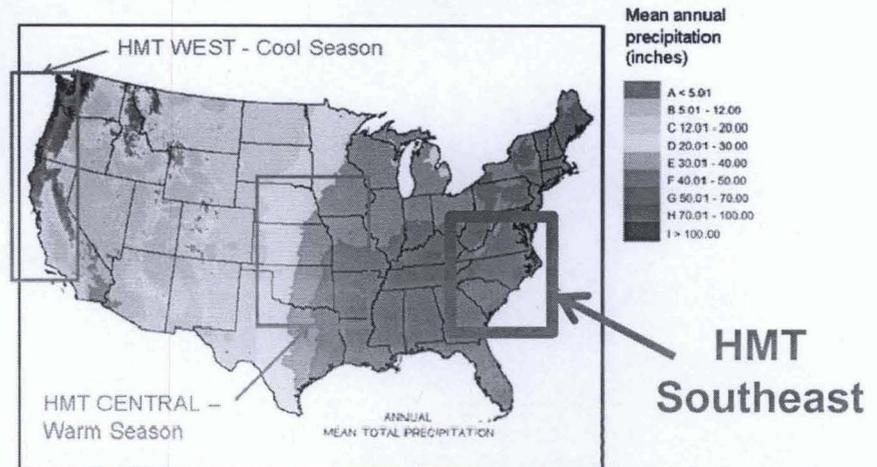

# Integrated Validation: Collaboration- NOAA Hydrometeorology Testbed (HMT)

End-to-end utility of retrieval algorithms: Pre-launch algorithm physics linked to hydrologic/water budget application, and hydrologic GV methods

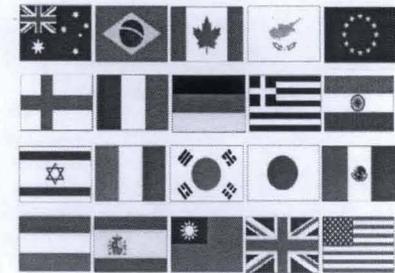

**HMT Southeast: "mountain to coast"**  
 Summer flooding, Hurricane Landfall,  
 Winter mixed events.....

**Extensive QPE and hydrologic  
 instrumentation, hydrologic modeling**

# ***International partnership: A Key to GPM GV success***

Potential GPM GV  
Sites and Partners

***NASA welcomes international participation in PMM Program GV activities to improve GPM products for the benefit of all nations***

***3rd International GPM GV Workshop held March 2008 in Buzios, Brazil***

***Numerous international investigators invited to submit (and are in the process of submitting) no-cost proposals to PMM to establish joint GV projects complement existing activities***

***19 Countries, 24 different activities targeting aspects of 3 core approaches***

***Scientific collaboration, data sharing, and leveraged field resources/efforts in joint projects as members of the PMM Science Team***

## GPM GV Success Criteria

- Providing **stable, calibrated surface precipitation measurements** for independent assessment of satellite-based precipitation estimates.
- Providing **useful** “microphysics laboratories” for improving performance of satellite algorithms and the quality of GPM data products.
- Providing **information for improving error characterization** of satellite precipitation products for NWP, multi-satellite precipitation analyses, climate re-analyses, and hydrological applications.
- Providing or supplementing **test beds for improving satellite precipitation data usage** in hydro-meteorological modeling and prediction.

# Summary

## *U.S. GV Science Implementation*

- Stresses involvement of algorithm teams in planning
  
- **Three Approaches**
  - **Direct Validation (Reflectivity, Rainrate)**
    - VN Architecture being steadily enhanced/expanded
    - U.S. and international radar datasets being incorporated
    - Expand to accommodate widespread rain rate validation for radiometers
  - **Physical Process (Land Focus)**
    - Core infrastructure development underway: Ka-Ku, N-POL, Disdrometers
    - Field campaigns: 5 Planned GPM/PMM
    - Near term field campaigns: Finland (2010), MC3E (2011), Cold Season (2012)
  - **Integrated (Hydrologic)**
    - NOAA HMT Southeast focus/collaboration underway (2010-2014)

## *International activities and collaboration (Required)*

- Rapidly gaining momentum
- Encourage Joint Research Proposals with NASA PMM Science Team along focusing on three GV approaches
