NASA Satellite Observations: A Unique Asset for the Study of the Environment and Implications for Public Health

Sue M. Estes
Deputy Program Manager, Public Health

National Aeronautics and Space Administration
Applied Sciences Program
Earth Science Division
Science Mission Directorate
Huntsville, AL
NASA Strategic Goal 3
Develop a balanced overall program of science, exploration, and aeronautics consistent with the redirection of human spaceflight program to focus on exploration.

NASA Sub-Goal 3A:
Study Earth from space to advance scientific understanding and meet societal needs.

NASA’s partnership efforts in global modeling and data assimilation over the next decade will shorten the distance from observations to answers for important, leading-edge science questions. NASA’s Applied Sciences program will continue the Agency’s efforts in benchmarking the assimilation of NASA research results into policy and management decision-support tools that are vital for the Nation’s environment, economy, safety, and security. NASA also is working with NOAA and inter-agency forums to transition mature research capabilities to operational systems, primarily the polar and geostationary operational environmental satellites, and to utilize fully those assets for research purposes.
Applied Sciences Program

*Eight Program Elements*

- Agricultural Efficiency
- Air Quality
- Climate
- Disaster Management
- Ecological Forecasting
- Public Health
- Water Resources
- Weather
Potential Health Effects of Climate Variability and Change

CLIMATE CHANGE (Natural and Human-Caused)

- Regional Weather Changes
  - ¥ Heat Waves
  - ¥ Extreme Weather
  - ¥ Temperature
  - ¥ Precipitation

Air Pollution Levels

Contamination Pathways

Transmission Dynamics

Health Effects

- Heat-related Illnesses and Deaths
- Extreme Weather Events-related Health Effects
- Air Pollution-related Health Effects
- Water- and Food-borne Diseases
- Vector- and Rodent-borne Diseases

Moderating Influences*

Research

Adaptation Measures**

Why public health?

Patz et al., 2000

Focus Areas of Public Health

The Public Health application area focuses on Earth science applications to public health and safety, particularly regarding infectious disease, emergency preparedness and response, and environmental health issues. The application explores issues of toxic and pathogenic exposure, as well as natural and man-made hazards and their effects, for risk characterization/mitigation and improvements to health and safety.
The Public Health application area focuses on Earth science applications to public health and safety, particularly regarding infectious disease, emergency preparedness and response, and environmental health issues. The application explores issues of toxic and pathogenic exposure, as well as natural and man-made hazards and their effects, for risk characterization/mitigation and improvements to health and safety.

**Programmatic Themes**

1. Environmental Health (including Oceans and Human Health) (9)
2. Infectious Disease (6)
3. Emergency Preparedness/Response (1)
4. Public Health Tracking/Information Networks (crosscuts)
5. Climate (crosscuts)

**Goals**

- Collaboration with other agencies to define the impact of climate change on public health
- Integration of NASA research into Public Health Information/Tracking Networks with the ability to track weather, climate, and environmental factors to improve disease outbreak and environmental health risk predictions to increase the public’s warning time
- NASA research utilized to enhance our nation’s emergency response and preparedness (e.g., DOD-GEIS, Coast Guard)
- Issue joint solicitations with other agencies
- Focus on upcoming missions (Decadal Survey)
- Through community, stay abreast and ahead of emerging diseases/issues (past – pandemic flu)

Avian Influenza Early Warning: Using NASA Data to Predict Pandemics

The 1918 flu was an influenza that spread to nearly every part of the world.

New Flu Strains Often Appear in SE Asia First Before Migrate to Other Regions. Migration Route of Seasonal Influenza A(H3N2) Virus. (Source: Russell et al., Vaccine 265 (2008))

OBJECTIVES

- Perform empirical AI outbreak risk analyses based on outbreak history, environmental parameters, and socio-economic factors.
- Identify spatiotemporal risk for AI outbreaks based on wetland distributions, prevalence of bird species, flyways of migratory birds, surface characteristics, and socioeconomic factors.
- Model the spread of AI virus from large commercial poultry farms to small and backyard farms under typical environmental and socioeconomic conditions.
- Model weekly influenza-like illness cases based on observed and forecast meteorological parameters for regions in the US and some tropical countries.

Most cases of avian influenza infection is human have resulted from contact with infected poultry like domesticated chickens, ducks, and turkeys.

This project establishes procedures to directly incorporate observations and model predictive capabilities into the CDC ArboNET and the California Mosquito-borne Virus Surveillance and Response Plan (CMVSRP) from NASA satellites and ecosystem models generated by the Terrestrial Observation and Prediction System (TOPS) at NASA Ames Research Center. At a minimum, the project will utilize observations from NASA MODIS and AMSR-E, Landsat, and NOAA AVHRR.

Preliminary data analysis suggest that variability in temperature and precipitation were two of the strongest drivers of the timing and spatial distribution of mosquito abundance. Climate variables have strong influences on mosquito populations and will have predictive value months- to seasons-in-advance. These associations vary in space and time, particularly among the ecologically diverse zones of California.
• NASA employs scientists with diverse backgrounds and expertise
• NASA researchers bring to the table a strong desire to collaborate
• Where to find NASA researchers
NASA has several avenues of external funding available to non-NASA scientists
