21000 Brookpark Road, Cleveland, Ohio 44135

Thermal barrier coatings will be more aggressively designed to protect gas turbine engine hot-section components in order to meet future engine higher fuel efficiency and lower emission goals. In this presentation, thermal barrier coating development considerations and performance will be emphasized. Advanced thermal barrier coatings have been developed using a multi-component defect clustering approach, and shown to have improved thermal stability and lower conductivity. The coating systems have been demonstrated for high temperature combustor applications. For thermal barrier coatings designed for turbine airfoil applications, further improved erosion and impact resistance are crucial for engine performance and durability. Erosion resistant thermal barrier coatings are being developed, with a current emphasis on the toughness improvements using a combined rare earth- and transition metal-oxide doping approach. The performance of the toughened thermal barrier coatings has been evaluated in burner rig and laser heat-flux rig simulated engine erosion and thermal gradient environments. The results have shown that the coating composition optimizations can effectively improve the erosion and impact resistance of the coating systems, while maintaining low thermal conductivity and cyclic durability. The erosion, impact and high heat-flux damage mechanisms of the thermal barrier coatings will also be described.

Motivation

Thermal barrier coatings (TBCs) can significantly increase gas temperatures, reduce cooling requirements, and improve engine fuel efficiency and reliability.
NASA Ceramic Coating Development Goals

— Meet engine temperature and performance requirements
  - improved engine efficiency
  - reduced emission
  - increase long-term durability
— Improve technology readiness
— The programs require a step-increase in coating capability
— Reliability critical

![Diagram showing temperature capability and step increase in T/EBC surface](image)

- 2800°F combustor TBCs
- 2500°F Turbine TBCs
- 3000°F+ (1650°C+)
- 3000°F SiC/SiC CMC coatings
- 2700°F SiC/SiC CMC and Si₃N₄ coatings
- 2400°F (1316°C)
- 2000°F (1093°C)
- Increase in ΔT across T/EBC
- Ceramic Matrix Composite
- Single Crystal Superalloy

Gen I – Current commercial
Gen II
Gen III
Gen. IV
Outline

— Simulated high-heat-flux testing approaches
  • Laser high heat flux
  • Burner and laser high temperature erosion
  • High pressure burner and high heat-flux capability

— Low conductivity thermal barrier coating developments
  • Low conductivity TBC design requirements
  • Performance of low k four-component TBC systems
    Conductivity, and cyclic durability
  • High toughness Low k four- and six-component turbine airfoil TBC development – erosion resistance
  • CMAS interaction testing

— Future directions

— Summary
High Heat-Flux Test Approaches

- High-heat-flux tests crucial for turbine TBC developments
  - CO₂ laser simulated turbine engine high-heat-flux rig
  - Atmospheric burner rig simulated heat flux testing
  - High pressure burner rig simulated engine heat flux and pressure environments

Turbine blade TBC testing requirements
- \( \Delta T \approx 450^\circ\text{F} (250^\circ\text{C}) \) across 5mil coating
- Heat flux up to 400 W/cm²

\begin{align*}
T_{\text{surface}} & \quad 2400-2500^\circ\text{F} \\
(1316-1371^\circ\text{C}) \\
T_{\text{interface}} & \quad 1950^\circ\text{F} \\
(1066^\circ\text{C}) \\
\text{Distance from surface} & \quad \text{cooling} \\
h_c = 0.4 \text{ W/cm²-K max}
\end{align*}
High Velocity Burner Erosion Rig and Laser high Heat Flux Erosion Test Rig for Turbine TBC Testing

- High precision particle feeder system

- Mach 0.3-1.0 burner erosion rig
- Laser heat flux erosion rig
ZrO$_2$-(7-8) wt%Y$_2$O$_3$
Thermal Barrier Coating Systems

- Relatively low intrinsic thermal conductivity ~2.5 W/m-K
- High thermal expansion to better match superalloy substrates
- Good high temperature stability and mechanical properties
- Additional conductivity reduction by micro-porosity

(a) Plasma-sprayed coating

(b) EB-PVD coating
Sintering and Conductivity Increase of ZrO$_2$-(7-8) wt%Y$_2$O$_3$

- Significant conductivity increase at high temperature due to sintering
- Accelerated failure due to phase stability and reduced strain tolerance
Sintering Kinetics of Plasma-Sprayed ZrO₂-8wt%Y₂O₃ Coatings

\[
\frac{k_c - k_c^0}{k_c^{\text{inf}} - k_c^0} = 102.2 \cdot \exp\left(-\frac{68228}{RT}\right) \left\{1 - \exp\left[-\frac{t}{\tau}\right]\right\}
\]

\[
\tau = 572.5 \cdot \exp\left(\frac{41710}{RT}\right)
\]

Sintering Cracks and Delaminations

High heat flux surface sintering cracking and resulting coating delaminations

Sintering Cracks and Delaminations - continued

Sintering strain corresponding to the thermal gradient across the coating ($T_{\text{surface}} = 1280^\circ\text{C}$, $T_{\text{interface}} = 1095^\circ\text{F}$)

\[ \text{strain (in\%) } = 0.40757 + 0.41 \cdot t \left( \text{in hr} \right)^{0.2} \]
Low Conductivity and Sintering Resistant Thermal Barrier Coating Design Requirements

- Low conductivity ("1/2" of the baseline) retained at 2400°F
- Improved sintering resistance and phase stability (up to 3000°F)
- Excellent durability and mechanical properties
  - Cyclic life
  - Toughness
  - Erosion/impact resistance
  - CMAS and corrosion resistance
  - Compatibility with the substrate/TGO
- Processing capability using existing infrastructure and alternative coating systems
- Other design considerations
  - Favorable optical properties
  - Potentially suitable for various metal and ceramic components
  - Affordable and safe
Low Conductivity Thermal Barrier Coating Design Approaches

- Efforts on modifying coating microstructures and porosity, composite TBCs, or alternative oxide compounds

- Emphasize ZrO$_2$- or HfO$_2$-based alloy systems – defect cluster approach for toughness consideration

- Advantages of defect cluster approach
  - **Advanced design approach**: design of the clustering
  - **Better thermal stability**: point defects are thermodynamically stable
  - **Improved sintering resistance**: effective defect concentration reduced and activation energies increased by clustering
  - **Easy to fabricate**: plasma-sprayed or EB-PVD processes
Development of Advanced Defect Cluster Low Conductivity Thermal Barrier Coatings

— Multi-component oxide defect clustering approach (Zhu and Miller, US Patents No. 6,812,176, No.7,001,859, and No. 7,186,466)
  e.g.: $\text{ZrO}_2\text{-Y}_2\text{O}_3\text{-Nd}_2\text{O}_3\text{(Gd}_2\text{O}_3\text{,Sm}_2\text{O}_3\text{)-Yb}_2\text{O}_3\text{(Sc}_2\text{O}_3\text{)}$ systems

— Defect clusters associated with dopant segregation
— The nanometer sized clusters for reduced thermal conductivity, improved stability, and mechanical properties

Defect Clusters in a Plasma-Sprayed Y$_2$O$_3$, Nd$_2$O$_3$ and Yb$_2$O$_3$ Co-Doped ZrO$_2$-Thermal Barrier Coating

High Heat Flux Testing of Turbine EB-PVD Thermal Barrier Coatings to Study CMAS Effect

- Specimens typically tested at $T_{\text{surface}} \sim 2400^\circ F$, $T_{\text{interface}} 2000^\circ F$
- Heat flux up to 250-300 W/cm$^2$, cooling heat transfer coefficient up to $h_c 0.32$ W/cm$^2$K
- Accelerated failure observed with CMAS interactions
- Advanced multi-component coatings completed 50 hr testing
Future Directions for Low Conductivity TBC Development

— Emphasize high heat flux durability and erosion resistance

- Optimize high toughness erosion resistant turbine coatings
- Improve turbine airfoil TBCs with up to 3x erosion resistance
- Emphasize creep, fatigue, erosion, and CMAS interactions
- Develop multilayered damping and erosion coatings
- Develop turbine blade TBC life prediction model
Future Directions for Low Conductivity TBC Development

— Emphasize thin ceramic matrix composite turbine coating processing
- Advanced processing for integrated TEBCs
- Ceramic nanocomposite and nanotube-based TEBCs for improved durability and optical properties
- Embedded sensors
- Life prediction methodology and design tool development

Summary

- Four-component low k TBC systems developed for low k combustor applications
- Advanced turbine airfoil TBCs being developed with combined low conductivity and high toughness
- Improved erosion/impact resistance observed for the multi-component coating t’ and t’/cubic nano-composite systems
- Coatings being optimized for cyclic life, thermal conductivity and erosion/impact and CMAS resistance
- High heat flux durability, multifunctional coatings and lifing models being emphasized in the current research programs
