TITLE OF TEAM: ABSTRACT BODY: AMONG THE PROCESSES GOVERNING THE ENERGY BALANCE IN THE MESOSPHERE AND LOWER THERMOSPHERE (MLT), THE QUENCHING OF $CO_2$(N2) VIBRATIONAL LEVELS BY COLLISIONS WITH OXYGEN ATOMS PLAYS AN IMPORTANT ROLE. HOWEVER, THE $K(CO_2-O)$ VALUES MEASURED IN THE LAB AND RETRIEVED FROM ATMOSPHERIC MEASUREMENTS VARY FROM $1.5 \times 10^{-12}$ $CM^3$ $S^{-1}$ THROUGH $9.0 \times 10^{-12}$ $CM^3$ $S^{-1}$ THAT REQUIRES FURTHER STUDYING. IN THIS WORK WE USED SYNERGISTIC DATA FROM A GROUND BASED LIDAR AND A SATELLITE INFRARED RADIOMETER TO ESTIMATE $K(CO_2-O)$.

WE USED THE NIGHT- AND DAYTIME TEMPERATURES BETWEEN 80 AND 110 KM MEASURED BY THE COLORADO STATE UNIVERSITY NARROW-BAND SODIUM (NA) LIDAR LOCATED AT FORT COLLINS, COLORADO (41N, 255E) AS GROUND TRUTH OF THE SABER/TIMED NEARLY SIMULTANEOUS ($\pm$10 MINUTES) AND COMMON VOLUME (WITHIN $\pm$1 DEGREE IN LATITUDE, $\pm$2 DEGREES IN LONGITUDE) OBSERVATIONS. FOR EACH ALTITUDE IN 80-110 KM INTERVAL WE ESTIMATE AN "OPTIMAL" VALUE OF $K(CO_2-O)$ NEEDED TO MINIMIZE THE DISCREPANCY BETWEEN THE SIMULATED 15 MM $CO_2$ RADIANCE AND THAT MEASURED BY THE SABER/TIMED INSTRUMENT. THE $K(CO_2-O)$ OBTAINED IN THIS WAY VARIES IN ALTITUDE FROM $3.5 \times 10^{-12}$ $CM^3$ $S^{-1}$ AT 80 KM TO $5.2 \times 10^{-12}$ $CM^3$ $S^{-1}$ FOR ALTITUDES ABOVE 95 KM. WE DISCUSS THIS VARIATION OF THE RATE CONSTANT AND ITS IMPACT ON TEMPERATURE RETRIEVALS FROM 15 MM RADIANCE MEASUREMENTS AND ON THE ENERGY BUDGET OF MLT.
