ABSTRACT

The Space Medicine Exploration Medical Condition List (SMEMCL) is an element of NASA's Human Research Program (HRP). The goal is to address the risk of the "Inability to Adequately Recognize or Treat an Ill or Injured Crewmember." This poster highlights the approach ExMC has taken to address this risk.

The Space Medicine Exploration Medical Condition List (SMEMCL) was created to define the set of medical conditions that are most likely to occur during exploration space flight missions. The list was derived from the International Space Station Medical Checklist, the Shuttle Medical Checklist, and the International Space Station Medical Project. The conditions were further prioritized by the ExMC Advisory Group, which includes flight surgeons, physician astronauts, engineers, and scientists. The clinical priority of each condition is based on incidence, consequence, and mitigation capability.

The purpose of the SMEMCL is to serve as an evidence-based foundation for the conditions that could affect a crewmember during flight. This information is used to ensure that the appropriate medical capabilities are available for exploration missions.

THE HUMAN RESEARCH PROGRAM

NASA's Human Research Program (HRP) conducts research and develops technologies that allow humans to travel safely and productively in the environment of space.

The HRP is comprised of six Elements:
- International Space Station Medical Project
- Space Radiation
- Human Health Countermeasures
- Exploration Medical Capability
- Behavioral Health and Performance
- Space Human Factors and Habitability

The National Space Biomedical Research Institute (NSBRI) is a partner with the HRP in developing a successful human research program.

The purpose of the SMEMCL is to serve as an evidence-based foundation for the conditions that could affect a crewmember during flight. This information is used to ensure that the appropriate medical capabilities are available for exploration missions.

BACKGROUND AND PURPOSE

There are approximately eighty conditions on the condition list approved by the NASA's Space Medicine Division.

For each design reference mission, conditions on the list were prioritized by the ExMC Advisory Group, which includes flight surgeons, physician astronauts, engineers, and scientists. The clinical priority of each condition is based on incidence, consequence, and mitigation capability.

The condition list is a "living document." New conditions can be added to the list, and the priority of conditions on the list can be adjusted as screening, diagnosis, or treatment capabilities change.

The purpose of the SMEMCL is to serve as an evidence-based foundation for the conditions that could affect a crewmember during flight. This information is used to ensure that the appropriate medical capabilities are available for exploration missions.

DEFINITIONS

The SMEMCL uses the following clinical priority scale describing which medical conditions will be given resources for diagnosis and treatment.

Shall – Diagnostic and treatment capability must be provided

Should – Diagnostic and treatment capability should be provided if mass/power/volume allow.

Not Addressed – No specific diagnostic and/or treatment capability will be manifested, but diagnostic and treatment resources manifested for other medical conditions may be used if needed. A condition was listed as being of no medical concern if it is highly unlikely to occur, is expected to be engineered out, or the limitations in the medical training, hardware, or consumables precludes its treatment.

THE NEAR-EARTH ASTEROID (NEA) DESIGN REFERENCE MISSION

Mission duration – 13 months
(6 months on the outbound journey, 1 month of surface or proximity operations, and 6 months on the return journey)
Crew size – 3 crewmembers (2 male, 1 female)
