Previous Open Rotor Research in the US

Previous Open Rotor noise experience in the United States, current Open Rotor noise research in the United States and current NASA prediction methods activities were presented at a European Union (EU) X-Noise seminar. The invited attendees from EU industries, research establishments and universities discussed prospects for reducing Open Rotor noise and reviewed all technology programs, past and present, dedicated to Open Rotor engine concepts. This workshop was particularly timely because the Committee on Aviation Environmental Protection (CAEP) plans to involve Independent Experts in late 2011 in assessing the noise of future low-carbon technologies including the open rotor.

NASA Advanced Turboprop Program (1975 – 1989)
• Overview/Objectives
• Wind tunnel tests
• Ground tests
• Flight tests
• Results
Objectives

- Reduce Fuel Consumption
- Lower Operating Cost
- Passenger Acceptance
Single Rotation and Counter Rotation Propfans
Low Speed Wind Tunnel tests
High Speed Wind Tunnel tests

One of the first applications of Laser Doppler Velocimetry (LDV) and blade deflection measurement methods
Verified Scalability
Ground and Integrated system tests

FY86 Significant Accomplishments—Large-Scale Systems

LARGE-SCALE PROPFAN RIG AND PTA AIRPLANE MODEL TESTING
ACCOMPLISHED TO VERIFY PERFORMANCE PRIOR TO FLIGHT TEST

Static Test at WPAFB
- First large-scale propfan test
- Acceptable blade stresses
- No stall flutter
- Stall buffet region defined

Modane High-Speed Tunnel Test
- Tested large-scale 8-, 4-, and 2-way blade configs. at tunnel speeds up to Mach 0.83
- Acceptable blade stresses
- No classical flutter

PTA Model Testing
- Completed high- & low-speed testing in LeRC tunnels
- Confirmed predicted PTA S&G/handling
- Verified PTA capability to fly to Mach 0.8/35,000 ft. propfan design point
- Confirmed high-speed buffet boundary is outside PTA flight envelope
- Verified analytical flow prediction approach
Flight tests

Major Contracts
- General Electric – UnDucted Fan (UDF)
- Hamilton Standard – Large Scale Advanced Propfan (LAP)
- Lockheed Georgia – Propfan Test Assessment (PTA)
Results

Overall Conclusions

• Fuel consumption can be reduced by 25 - 30% compared to equivalent technology turbofans.
• Depending on fuel prices, the operating cost can be reduced by 7 - 15%.
• Community noise levels can meet Stage 3 requirements.

Technology Development

• High speed propeller design, test methods and data bases.
• Aerodynamic and acoustic prediction codes (first application of advanced CFD).
• Aeroelastic analyses including blade coupling, composite blades.
• Advanced measurement methods.

Outline

- NASA Aeronautics Research Mission Directorate (ARMD)
- Open Rotor Research at NASA
  - NASA/GE collaboration
  - Rig and facility details
  - Low speed isolated/installed data
  - Detailed aero/acoustic measurements
  - Acoustic shielding
  - Propulsion/Airframe aeroacoustics
- FAA Continuous Lower Energy, Emissions and Noise (CLEEN) Program
- FAA/CLEEN Open Rotor Research
NASA Aeronautics Portfolio in FY2010

**Fundamental Aeronautics Program**
Conduct cutting-edge research that will produce innovative concepts, tools, and technologies to enable revolutionary changes for vehicles that fly in all speed regimes.

**Airspace Systems Program**
Directly address the fundamental ATM research needs for NextGen by developing revolutionary concepts, capabilities, and technologies that will enable significant increases in the capacity, efficiency and flexibility of the NAS.

**Integrated Systems Research Program**
Conduct research at an integrated system-level on promising concepts and technologies and explore/assess/demonstrate the benefits in a relevant environment.

**Aviation Safety Program**
Conduct cutting-edge research that will produce innovative concepts, tools, and technologies to improve the intrinsic safety attributes of current and future aircraft.

**Aeronautics Test Program**
Preserve and promote the testing capabilities of one of the United States’ largest, most versatile and comprehensive set of flight and ground-based research facilities.
Program Goal:
Conduct research at an integrated system-level on promising concepts and technologies and explore, assess, or demonstrate the benefits in a relevant environment

Environmentally Responsible Aviation (ERA) Project
Explore and assess new vehicle concepts and enabling technologies through system-level experimentation to simultaneously reduce fuel burn, noise, and emissions

Unmanned Aircraft Systems (UAS) Integration in the National Airspace System (NAS) Project
Contribute capabilities that reduce technical barriers related to the safety and operational challenges associated with enabling routine UAS access to the NAS

Innovative Concepts for Aviation (ICA) Project
Spur innovation by offering research opportunities to the broader aeronautics community through peer-reviewed proposals. Establish incentive prizes similar to the Centennial Challenges and sponsor innovation demonstrations of selected technologies that show promise of impacting aviation challenges.
NASA’s Subsonic Transport System Level Metrics
Sumarizing the potential technology payoff …

... Innovative technology for dramatically reducing noise, emissions and fuel burn

***Technology Readiness Level for key technologies = 4-6. ERA will undertake a time phased approach, TRL 6 by 2015 for “long-pole” technologies
** RECENTLY UPDATED. Additional gains may be possible through operational improvements
* Concepts that enable optimal use of runways at multiple airports within the metropolitan area
Open Rotor Research at NASA
The NASA/GE Collaboration on Open Rotor Testing

- **Objective:** Explore the design space for lower noise while maintaining the high propulsive efficiency from a counter-rotating open rotor system.

- **Approach:** A low-noise open rotor system is being tested in collaboration with General Electric and CFM International, a 50/50 joint company between Snecma and GE. Candidate technologies for lower noise will be investigated as well as installation effects such as pylon integration.

9ft. x 15ft.
Low Speed Test Section
MACH NO.: 0–0.2

8ft. x 6ft.
Supersonic Test Section
MACH NO.: 0.25–2.0
Altitude: Sea level to 35,000 ft.
Tunnel pressure: 2400 to 3700 lb/ft²
Temperature: 80 to 200 °F
Drive motors 87,000 HP
The Open Rotor Propulsion Rig (ORPR)

750 SHP per rotor
Rotating force balance:
  430 Lbf thrust per rotor
  550 ft-lb torque per rotor

1/5 to 1/7 of Full Scale
Independently controlled rotor speeds
Digital telemetry units for and aft
12 strain gage channels per rotor
Adjustable rotor spacing
Acoustic Configuration

18° forward to 140° aft angles

60” sideline
A detailed aerodynamic performance data set was acquired for all blade sets as well as acoustic measurements at 18 axial locations.
ERA Diagnostics: Historical Baseline Installation effects

The presence of the CFMI pylon induces distortions into blade rows causing noticeable increase in the levels of the individual rotor harmonics.
Objectives: Aerodynamic performance and near field unsteady pressure measurements at cruise Mach number.

Installation of ORPR into the 8x6 began in December 2010.
The ERA Diagnostics Program

| Acoustic Phased Array | Farfield acoustics with Pylon | Pressure Sensitive Paint | Stereo Particle Image Velocimetry | Acoustic Shielding |

The goal is a comprehensive data set that will identify noise sources and enable improved performance and acoustic modeling of open rotor systems.
ERA Diagnostics: Detailed Historical Baseline flowfield measurements

The 3D PIV measurements provide a wealth of information about the blade wakes and vortex track.

The Pressure Sensitive Paint measurements show phase locked static pressure on the surface of the rotating blade.
ERA Diagnostics:
Historical Baseline Installation effects (1)

The location of peak noise level in the **phased array** map changes in the presence of the CFMI pylon indicating a change in the relative strength of sources.
ERA Diagnostics:
Historical Baseline Acoustic Shielding

Semi-infinite acoustic barrier wall.
ERA Diagnostics: Historical Baseline Acoustic Shielding (2)

Detail from 0.5 kHz to 10 kHz
A complex pattern of tone constructive and destructive interference is apparent.

The ‘shadow’ of the barrier wall is visible as a 5 dB reduction region in this view from 0.5 kHz to 50 kHz, however the behavior of tones is more complicated.
NASA/Boeing Open Rotor PAA Experiment

Experiment of open rotor PAA effects for both HWB and Tube-and-Wing aircraft types in Boeing’s LSAF completed November 15, 2010
Dr. Michael Czech, Boeing PI & Dr. Russ Thomas, NASA TM

Objectives:
• Measure PAA effects
• Study options for increasing shielding effectiveness
• Acquire data for system noise assessment and prediction methods

Instrumentation:
• Far Field Microphones
• Near Field Mic Traverse
• Flow Field Survey
• Phased Array Traverse
• Surface Unsteady

Funded by the NASA Environmentally Responsible Aviation Project, Dr. Fay Collier, Project Manager
Experimental Parameter Summary:
- rotor speed variation
- wind tunnel Mach variation
- rotor to airframe relative position, axial and vertical
- off-center and centerline positions
- inboard verticals, size and cant angle
- elevon deflection

For HWB aircraft concept, there has been rapid progress in technology and assessments to meet the noise goal of the N+2 goals
FAA CLEEN Program

- Address NextGen environmental goals in partnership with industry (50% cost share, $125M over 5 yrs)
- Mature and demonstrate promising energy efficient, clean and quiet technologies
- Advance sustainable alternative fuels for aviation
- Assess technology suitability for retrofit or re-engine
- Meet national R&D goals

Boeing | GE | Honeywell | Pratt & Whitney | Rolls-Royce
# CLEEN Program* Goals

Develop and demonstrate (TRL 6-7) certifiable aircraft technology

The table above outlines the timeline for the Open Rotor Aero Acoustic Technology Program Plan, detailing the tasks and their respective timelines for the years 2009, 2010, and 2011.
Summary

- Under the NASA/GE collaboration, 5 modern design blade sets have been tested for aero/acoustic performance at Takeoff/Approach Mach and are currently being tested for performance at cruise Mach.

- The Historical Baseline blade set is also being tested at low and high speed for acoustic and aerodynamic performance characteristics. Data from this blade set will form a benchmark test case for open rotors.

- The NASA ERA program produced a comprehensive data set of flow field and acoustic data which includes phased array, particle image velocimetry, and pylon installed acoustics.

- Acoustic shielding and Propulsion Airframe Aeroacoustics research is making good progress.

FAA/CLEEN Program is a collaborative technology development effort. Evaluate current state-of-the art of Open Rotor Fan Blade designs relative to program goals:
- 26% fuel burn reduction (relative to CFM56-7B)
- 15 to 17 EPNdB noise reduction (relative to stage 4)
- Leverages Historic GE/NASA UDF Program and GE 1980’s product development Closely linked to the NASA Environmentally Responsible Aviation (ERA) Program
Open Rotor Simulation Work at NASA

Aeroacoustics of High-Speed Aircraft Propellers and Open Rotors

Institute of Aviation, Warsaw, Poland
October 7-8, 2010

X-Noise Workshop, Lausanne, Switzerland
March 18, 2011
The research described here is sponsored and funded by NASA’s Environmentally Responsible Aviation (ERA) and the Subsonic Fixed Wing (SFW) projects. Dr. Fay Collier is the ERA Project Manager and Dr. Rubén Del Rosario is the SFW Project Manager.

Research work noted here is carried out collaboratively by the NASA acoustics team at the Ames, Dryden, Glenn, and Langley Research Centers.

The collaboration of our partners at General Electric Aviation is gratefully acknowledged.
In collaboration with industry and academic partners, NASA is exploring the design space for low-noise open rotor systems.

The focus is on system level assessment of the merits of open rotor propulsion system in meeting NASA’s subsonic transport goals.
Unlike conventional propellers, for open rotors, blade aeroelastics and aerodynamics are coupled and, together with blade geometry (planform, hot shape, tip design, airfoil distribution, etc.), influence the blade acoustic signature.

Large-scale flow aerodynamic simulation work has been undertaken to generate the aerodynamic input needed by the noise codes.
Note: State of the art (or practice) for modeling and prediction is not the same for all noise sources or types.

Increasing Complexity

Increasing Resource Req.
Analysis & Prediction
Acoustic Analogy Challenges

Steady/Unsteady Aerodynamic Simulations
Used to Define Acoustic Source Strength Distribution

Ffowcs-Williams Hawkings Eq., Kirchhoff Surface Method
Used for Computing Acoustic Radiation from the Blade

• Accuracy of the acoustics results is strongly influenced by
  the underlying aerodynamic input.
• Need efficient computational methods and strategies for
  computing aerodynamic input. Currently using ADPAC
  for steady calculations and TURBO for unsteady.
ASSPIN (Advanced Subsonic and Supersonic Propeller Induced Noise) is a time domain code that computes the Green’s function solutions of the Ffowcs-Williams and Hawkings equation for propellers in forward flight. Its features are:

- Thickness and loading noise sources are included, but quadrupole source is neglected.
- Valid through subsonic, transonic, and supersonic helical blade speeds.
- User provides blade geometry, aerodynamic loading (steady/unsteady), and operating conditions. Code produces acoustic pressure time signals.
- Developed in 1980s by Farassat, Dunn, and Padula.

ASSPIN2 – Code was modernized in 2009 to include general unsteady blade loading for broadband, counter-rotating rotors, and component installation applications.

ASSPIN Research Engineers: Feri Farassat and Doug Nark
Like ASSPIN, LINPROP and QPROP are based on the Ffowcs-Williams & Hawkings Equation and have similar features/capabilities/requirements. However, they are formulated in the frequency-domain and use large-blade-count asymptotic approximation to compute the various source terms.

- The asymptotics are applied to the source efficiency integral only and the full details of the blade geometry and flowfield are retained.
- Formulation is uniformly valid across helical blade speed range.
- LINPROP computes thickness and loading noise contributions. QPROP computes quadrupole source contribution.
- Developed in early 1990s by Envia and recently extended to account for counter-rotating rotors and installation effects.
Analysis & Prediction
Noise Shielding/Scattering Prediction Code

- Fast Scattering Code (FSC) is a numerical code for calculating the scattering and reflection of incident acoustic waves on an arbitrary surface.
- It is based on the equivalent sources method and uses fast multi-pole technique to reduce CPU time requirements.

Hybrid Wing Body
L = 41 m
b = 64 m

Simulated Open Rotor Sources

Symmetry Plane

Rotor Plane
Summary

- NASA is researching open rotor propulsion as part of its technology research and development plan for addressing the subsonic transport aircraft noise, emission and fuel burn goals.

- The open rotor research is focused on system level metrics, but it also encompasses research at component level to build knowledge and improve the design and analysis tools.

- Ultimately, the objective is to provide a portfolio of low-noise open rotor technologies to aircraft designers that do not compromise the other performance aspects of the aircraft.

- A complementary objective is to develop and improve NASA’s noise prediction tools for advanced engines and installation configurations.
