Medical Updates to the International Space Station Probabilistic Risk Assessment Model Using the Integrated Medical Model

Presenters:
Doug Butler, Project Manager
Dr. Eric Kerstman, Clinical Lead

Presentation to the Multilateral Medical Operations Panel
NASA Johnson Space Center
SLSD/SD/SD4/Wyle
Houston, TX
4 May 2011
Purpose/Agenda

• **Purpose:** To inform the MMOP of the current IMM capability, and present the updated medical risk estimates approved for use by the Space Station Program.

• **Select the appropriate box below:**
  - [ ] Request for Technical Concurrence
  - [ ] Request for Partial Implementation
  - [ ] Request for Full/Final Implementation
  - [ ] Information Only/Management Direction
  - [ ] Response to an Action Item

This presentation was previously reviewed/dispositioned at:

Diagnosis and Treatment of Medical Conditions

What is the likelihood of a medical evacuation?
What is the risk of Loss of Crew Life due to illness on ISS?
What medical devices should we have on ISS?
What should be in the Expedition Medical Kit?

Clinical Outcomes and Mission Impact

ISS Medical System Resources
Mission Duration and Profile
Crew Member Attributes
Risks due to EVAs

Medical Condition Incidence Data
Functional Impairments
Medical Resource Attributes
Diagnosis and Treatment of Medical Conditions

Flight Surgeon

Life Before IMM
Life Now with IMM

Mission Specific Inputs
- Crew Member Attributes
- Crew Composition
- Mission Duration and Profile

Monte Carlo Simulations
- Integrated Medical Model

Quantified Outputs
- Type and Quantity of all medical events
- Risk of EVAC
- Risk of Loss of Crew
- Medical Resources Used
- Optimized medical system within vehicle constraints

Informed Analysis
- Flight Surgeon

ISS Medical System Resources
- Diagnosis and Treatment of Medical Conditions
- Medical Condition Incidence Data
- Risks due to EVAs

IMM Relational Database

13,500+ data elements
Background

• IMM Approach
  • Represents specific (83) medical conditions (including nine space adaptation conditions)
  • Accounts for ISS-based medical capability
  • Bounds clinical outcome uncertainty via best-case, worst-case, and untreated-case scenarios

• IMM development started in June 2005, and funded by Human Research Program

• Transitioned from research to ops, Feb 2011

• Provides evidence-based optimization of in-flight medical system mass and volume
Release History

- FY 2005: Project Kickoff
- April 2008: Project Technical Review
- Sept 2008: IMM v1.0 – Proof of Concept Complete
- Oct 2008: Conceptual Model Review
- Mar 2009: Software Transition from Crystal Ball to SAS 9.1
- Sept 2009: IMM v2.0 – Beta version of relational database
- Oct 2010: IMM v3.0 - Integrated with Database
- Dec 2010: ISS Program Accepts Risk Forecasts
- Feb 2011: Transition to Operational Tool
IMM Evidence Base

• Astronaut Health Database
• ISS Expeditions 1 thru 13 (2006)
• STS-01 thru STS-114 (2005)
• Apollo, Skylab, Mir (U.S. crew only)
• Analog, terrestrial data
• Review of crew medical charts
• Flight Surgeon Subject Matter Expertise
• Russian medical data not used
Comparison – 5x5 Risk Matrix vs. IMM

5x5 Matrix
- Qualitative
- Categorical
- Subjective
- Single Risk
- No Uncertainty
- No Confidence Interval
- Limited context

IMM
- Quantitative
- Probabilistic, Stochastic
- Evidence-based
- Integrated Risks
- Uncertainty
- Confidence Interval
- In context

- Medical Conditions & Incidence Data
- Crew Profile
- Mission Profile & Constraints
- Potential crew impairments and mission end states
- In-flight Medical Resources

Type and quantity of all medical events
- Crew Impairment, Mission and Clinical End States
- Resources used
- Optimized medical system within vehicle constraints
Event Sequence Diagram

Best-case resources available?

Yes

Treated case: Decrement medical resources

Calculate End States:
- Risk of Evacuation
- Risk of Loss of Crew Life
- Type and Quantity of Medical Events organized by Medical, Injury, or Environmental categories
- Crew Functional Impairment
- Resource Utilization and Depletion

No

Untreated Best-Case

Worst-case Scenario

Medical Event

Worst-case resources available?

Yes

Treated case: Decrement medical resources

No

Untreated Worst-Case

Best-case Scenario
Status of IMM

- Past Uses of the IMM
  - ISS medical system re-design
  - IV Fluid “What if” Assessment
  - Storage Capacity Requirements of Vomitus/Diarrhea for Constellation
  - Constellation medical kit design support
  - ISS Emergency Return Vehicle Analysis
  - Near Earth Asteroid Mission Support (HEFT DRM4)
- Validation and Verification of clinical data
- Documentation of methods and innovations
- Migrating clinical evidence to IMM database
- Establishing web-based external review capability
- Enhancing database reporting capabilities
Verification & Validation (V&V) Status

- Established and implemented V&V Plan
- V&V Plan includes internal and external reviews
- Key IMM elements identified for V&V
- V&V Plan approved via the NASA STD 7009 process
- Established NASA STD 7009 Credibility and Compliance Matrixes for IMM

Methods

- Reference Mission (as defined by ISS PRA Group)
  - 6-person crew (1 female, 5 males)
  - 6-month mission
  - 3 EVAs total for mission
- Industry standard statistical software, SAS 9.1
- Monte Carlo simulations (100K trials)
- Fully-treated scenario using the ISS medical system
Key Assumptions and Limitations

- Accurate diagnosis of all medical events
- Treatments are effective
- 100% reliable medical equipment
- All medical events occur on day one of mission
IMM Definition of Medical Evacuation

• Evacuation is considered as the mission end state when the medical event has the potential to result in any of the following
  
  • Loss of crew life
  • Permanent impairment
  • Intractable pain or suffering
  • Inability to complete mission critical tasks
  • Persistent disturbance of behavior, thought or mood that may lead to harm to self or others (psychiatric emergency)
# Results – EVAC and LOC

## ISS Reference Mission - Fully Treated

</table>
Conversion of % EVAC to events/person-yr

- IMM forecasts a 4.43% probability of EVAC for a 6 crew/6 month ISS mission
  - 6 crew x 0.5 years (6 months) = 3 person-yrs
  - 0.0443 events/3 person-yrs = 0.015 events/person-yr

- IMM forecasts a 1.06% probability of LOC for a 6 crew/6 month ISS mission
  - 6 crew x 0.5 years (6 months) = 3 person-yrs
  - 0.0106 events/3 person-yrs = 0.0035 events/person-yr
Comparison of *Risk of EVAC* Rates

IMM forecasted *Risk of EVAC* rate (0.015) compares favorably with literature review EVAC rates (0.010 to 0.072)

# Validation - Risk of EVAC

## IMM Simulation Data

**Medical illness (71%)**
1. Dental Abscess
2. Sepsis
3. Kidney Stones
4. Stroke
5. Atrial Fibrillation
6. Acute Chest Pain/Angina

**Injury/Trauma (13%)**
1. Hypovolemic Shock
2. Wrist Fracture

**Environmental (16%)**
1. Smoke Inhalation
2. Toxic Exposure

## Actual Russian Flight Data

**Three EVACs**
1. Urosepsis
2. Cardiac Arrhythmia
3. Smoke Inhalation

**Three Close Call EVACs**
1. Kidney Stone
2. Dental Abscess
3. Toxic Exposure

---

**NOTE:** No Russian data are in IMM
Recent Medical Events

- Although papilledema and ocular issues have come to the forefront, currently there is not enough knowledge to know when or if this problem could reach the level requiring evacuation. As data becomes available, it will be added to the model.
Validation – *Risk of LOC* forecast

IMM forecasted *Risk of LOC* rate (0.0035) compares favorably with literature review results for LOC rates (0.0028 to 0.0081)

<table>

</table>

* Shown as events/person-year, and percent during mission
Impact to ISS PRA

PRA 2.1.1

- EVAC: 1.22E-02 (1 in 82)
- LOC: 8.83E-03 (1 in 113)

PRA 2.1.1 with IMM

- EVAC: 5.22E-02 (1 in 19)
- LOC: 1.78E-02 (1 in 56)
Impact to ISS PRA - EVAC

EVAC PRA 2.1.1

EVAC PRA 2.1.1 with IMM
Impact to ISS PRA - LOC

LOC PRA 2.1.1

LOC PRA 2.1.1 with IMM
Forecast of Medical Evacuations on ISS To Date

- 61% probability of no medical evacuation to date
- 39% probability of one or more medical evacuations to date
- Assumes a 4.43% probability of evacuation for a 6-crew, 6-month increment.
  - 3 person-years per increment
- Assumes 33 person-years of ISS crew time to date.
Closing

• Medical events will be lead contributor to “Risk of EVAC/LOC”, surpassing ISS PRA estimates of “Risk of EVAC/LOC” from MMOD

• A comprehensive evidence review forms the basis for updating the ISS PRA Risk Model
Open Discussion and Questions

IMM
Updated ISS PRA EVAC and LOC Forecasts

Probabilities at least one EVAC or LOC

</tr>
</tbody>
</table>
Emergent Evacuation

IMM Results from Emergency Return Vehicle Trade Study (May 2010)

Estimated Emergent EVAC Probability = 1.2%

1. Kidney Stone 0.33%
2. Smoke Inhalation 0.22%
3. Toxic Exposure 0.20%
4. Sepsis 0.15%
5. Hypovolemic Shock 0.10%

Note: Based on 3 crew/6 month ISS mission
Environmental Risk Discussion

- Environmental Conditions in IMM
  - *Smoke Inhalation*
  - *Toxic Exposure*
  - Acute Radiation Syndrome
  - Altitude Sickness
  - Barotrauma (ear/sinus block)
  - Burns
  - Decompression Sickness (EVA)
  - Headache (CO$_2$ induced)
Environmental Risk Discussion

• Differences between ISS PRA and IMM
  • IMM estimates the incidence of smoke inhalation and toxic exposure based on historical data of crew medical events
  • ISS PRA estimates the incidence of smoke inhalation and toxic exposure based on the probability of ISS system failures
  • Since the ISS PRA does not consider the medical risk of smoke inhalation and toxic exposure, it is valid to include these conditions in the IMM as contributors to the risk of EVAC and LOC
IMM Intravenous Fluids (IV) Analysis

| Outcome | IV Fluids | No IV Fluids *
|---------|-----------|----------------
| CHI (%) | 93.79     | 93.48          |
| EVAC (%)| 3.64      | 7.26           |
| LOCL (%)| 1.09      | 2.40           |

Outcomes are based on a 6 month/6 crew ISS mission

* Conservative (high) estimates of outcomes based on IMM limitation that medical conditions requiring IV fluids go untreated
