Nanosensor-Cellphone Integration for Extended Chemical Sensing Network

Jing Li, Ph.D.
Principal Investigator
NASA Ames Research Center

Developed in partnership with the U.S. Department of Homeland Security Science & Technology Directorate.
What is it?
An integrated sensing system!

NASA Nano sensor chips (chemical detection)

Smartphones (acquire and transmit sensor data)

3G or Wi-Fi

Internet server (standardized and encrypted data packets)

NASA Cell-All Mission Control

Information process and control centers

DHS S&T Cell-All

EOC

NC4

Applications

The Internet
NASA Nanosensor Technology
- 5 US patents and 14 publications

- Nanosensor – low power, small size, high sensitivity, highly integrated system
- NASA engineering – Nanosensors are space qualified, quick turn around prototyping

DHS funded to develop cellphone sensors for early warning of a hazardous event.

Using pattern matching algorithms, the data is converted into a unique response pattern

Government agencies leverage resources to develop technology for their own missions as well as to benefit the public.

NASA has invested 8 years to develop this nanosensor technology.
Sensor-Phone Integration

Hardware (sensing module):
- Chemical detection
- Temperature
- Pressure
- Humidity
- GPS

Software (App):
- Data processing
- Data transmission
- Command exchange
- Embedded intelligence

Nanosensors:
- Sensitivity: ppm-ppb
- Power: µW –mW
- Response: seconds
- One button operation
- No consumables

Features:
- Self alert
- Network alert

DHS S&T Cell-All

NASA Supported Small Business:
Dr. George Yu, VARIABLE TECHNOLOGIES
Extended Sensing Network

Chemical info:
- ID & Concentration
- Temperature
- Pressure
- Humidity
- GPS location
