This invention relates to the compositions and processes for preparing thermoset and thermoplastic polyimides derived from novel asymmetrical dianhydrides: specifically 2,3,3',4'-benzophenone dianhydride (a-BTDA), and 3,4'-(hexafluoroisopropylidene)diphthalic anhydride (a-6FDA). The a-BTDA anhydride is prepared by Suzuki coupling with catalysts from a mixed anhydride of 3,4-dimethylbenzoic acid or 2,3-dimethylbenzoic acid with 2,3-dimethylphenylboronic acid or 3,4-dimethylphenylboronic acid respectively, to form 2,3,3',4'-tetramethylbenzophenone which is oxidized to form 2,3,3',4'-benzophenonetetracarboxylic acid followed by cyclodehydration to obtain a-BTDA. The a-6FDA is prepared by nucleophilic trifluoromethylation of 2,3,3',4'-tetramethylbenzophenone with trifluoromethyltrimethylsilane to form 3,4'-(trifluoromethylmethanol)-bis(o-xylene) which is converted to 3,4'-(hexafluoroisopropylidene-bis(o-xylene). The 3,4'-(hexafluoroisopropylidene-bis(o-xylene) is oxidized to the corresponding tetraacid followed by cyclodehydration to yield a-6FDA.
POLYIMIDES DERIVED FROM NOVEL ASYMMETRIC DIANHYDRIDES

RELATED U.S. APPLICATION

ORIGIN OF INVENTION

The invention described herein was made by an employee of the United States Government and may be manufactured and used by or for the Government for governmental purposes without the payment of any royalties thereon or therefor.

FIELD OF THE INVENTION

This invention relates to the composition and the process for preparing polyimides derived from asymmetric dianhydrides namely: 2,3,3',4'-biphenyldianhydride (a-BPDA), 2,3,3',4'-benzophenone dianhydride (a-BTDA), 3,4'-methylene-diphthalic anhydride (a-MDPA) and 3,4'-(hexafluoroisopropylidene)diphthalic anhydride (a-6FDA). These dianhydrides were prepared by cross-coupling dimethylphenylboronic acid and o-xylene derivatives via Suzuki coupling with various catalysts to form 2,3,3',4'-tetramethyl-biphenyl and 2,3,3',4'-tetramethylbenzophenone. The asymmetrical tetramethylbiphenyl and the tetramethylbenzophenone were oxidized to the corresponding tetracarboxylic acids which were then converted to asymmetrical 2,3,3',4'-biphenyl dianhydride and 2,3,3',4'-benzophenone dianhydride. In addition, the benzophenone tetracarboxylic acid can be reduced by hydrazine hydrate to 3,4'-methylene diphthalic tetracarboxylic acid which is converted to the corresponding 3,4'-methylenediphthalic anhydride. The unique feature of this invention is that it allows for the production of a series of asymmetric dianhydrides, not only a-BPDA, but also a-BTDA, a-MDPA and a-6FDA. This capability of producing a-BPDA, a-BTDA, a-MDPA and a-6FDA, will provide innovation for the preparation of high Tg low-melt viscosities and colorless polyimides with interesting and novel properties for aerospace and electronic applications.

More specifically, this invention relates to the composition and process for preparing polyimides derived from intermediates 2,3,3',4'-benzophenonetetracarboxylic acid or 3,4'-(hexafluoroisopropylidene)diphthalic acid and the corresponding asymmetric anhydrides. For example, thermosetting polyimides derived from a-BPDA, a-BTDA, a-MDPA and a-6FDA have been shown to produce low melt viscosity and high Tg polyimides for resin transfer molding; see the Proceedings of the SAMPE Symposium, Long Beach, Calif., May 1-5, 2005. Recently, it was discovered that asymmetric 2,3,3',4'-biphenyl dianhydride (a-BPDA) reacted with diamines and an endcap to produce polyimides with lower-melt viscosities and higher glass transition temperatures. (Tg) than the symmetrical 3,3',4,4'-biphenyldianhydride (s-BPDA); see High Performance Polymers, Vol. 13, 355 (2001), and Vol 15, 375 (2003).

BACKGROUND OF THE INVENTION

Currently, for example, asymmetrical a-BPDA is being prepared from o-xylene via an oxidative coupling reaction which essentially yields a mixture of 3,3',4,4'-biphenyl dianhydride (s-BPDA) and a minor product (2-6%) of a-BPDA. Consequently, a-BPDA is being produced in limited quantity and therefore is not commercially available in sufficient amounts, despite an enormous interest in preparing polyimides using a-BPDA. This disclosure provides alternative and more efficient processes for producing polyimides derived from asymmetric 2,3,3',4'-biphenyl dianhydride (a-BPDA), 2,3,3',4'-benzophenone dianhydride (a-BTDA), 3,4'-methylene-diphthalic anhydride (a-MDPA) and 3,4'-(hexafluoroisopropylidene)diphthalic anhydride (a-6FDA).

The prior art (U.S. Pat. No. 3,940,426, UBE Industries) process for making a-BPDA relies on oxidative coupling of o-xylene or o-phthalate with an organic acid salt of palladium under oxygen pressure to produce a mixture of symmetrical and unsymmetrical intermediates which are oxidized and cyclodehydrated to form a mixture of a-BPDA and s-BPDA. This mixture requires the additional process of separating the two isomers.

U.S. Pat. No. 4,294,976 discloses a process for preparing a mixture of biphenyltetracarboxylic acids (3,3',4,4'-isomer, 2,3,3',4'-isomer and 2,2',3,3' isomer) via an oxidative coupling of either o-xylene or o-phthalate in the presence palladium catalyst followed by hydrolysis. The mixture of isomeric biphenyltetracarboxylic acids were then subjected to fractionally recrystallization to obtain the corresponding 2,3,3',4'-amine, and 2,2',3,3'-amine.
U.S. Pat. No. 4,958,002 discloses a dehydration process to obtain 3,3',4,4'-biphenyl dianhydride after the corresponding 3,3',4,4'-biphenylytetraacarboxylic acid was isolated from 2,3,3',4'-biphenylytetraacarboxylic acid. U.S. Pat. No. 5,258,530 (Mitsubishi) describes a coupling reaction of phthalic anhydride to form a mixture of 2,3,3',4'-major and 2,3,3',4'-minor biphenyl dianhydrides. U.S. Patent Publication No. 0088120 A1 (2003) discloses a process for producing predominantly 2,3',3',4'-biphenyl dianhydride (a-BPDA) with a minor amount of 3,3',4,4'-biphenyldianhydride (s-BPDA) using palladium and copper catalyst with bidentate ligand. This prior art processes all yield mixtures of asymmetrical dianhydrides together with symmetrical dianhydrides, which then requires the separation of these isomers. In comparison, this invention discloses asymmetrical coupling of dimethylphenyboronic acid with o-xylene derivatives to provide asymmetrical dianhydrides without contamination by the symmetrical dianhydrides.

**SUMMARY OF THE INVENTION**

By employing a cross-coupling reaction (Suzuki coupling) with 3,4-dimethyl or 2,3-dimethylphenylboronic acid and 3- or 4-substituted o-xlenes in the presence of catalysts, this invention exclusively produces asymmetric precursors; namely, 2,3,3',4'-tetramethylbiphenyl and 2,3,3',4'-tetramethylbenzophenone. These precursors are subsequently oxidized to produce asymmetric tetracarboxylic acids which are converted to the corresponding dianhydrides.

These asymmetric dianhydrides are useful in preparing polyimides which comprise an important class of polymers because of their desirable characteristics i.e. low dielectric constant, high breakdown voltage, good wear resistance, radiation resistance, inertness to solvents, good adhesion properties, hydrolytic stability, low thermal expansion, long-term stability, and excellent mechanical properties. Specifically, high temperature polyimides, such as PMR-15, are extremely valuable particularly for aerospace applications. However, making components from these polyimides via prepreg process is labor intensive and expensive. Resin Transfer Molding (RTM) is a more cost-effective alternative to making aerospace components and has been successfully deployed with lower temperature polymers such as the epoxies and bismaleimides (BMI).

A unique feature of this invention is the processes for preparing novel asymmetrical dianhydrides, namely, a-BTDA and a-6FDA, without the contamination of their symmetrical isomers (s-BTDA and s-6FDA). The a-BTDA and a-6FDA can be used to formulate or prepare polyimides with low-melt viscosities without the use of high-boiling point organic solvents such as N-methyl-pyrrolidinone (NMP) whereas the conventional polyimides derived from s-BTDA and s-6FDA usually provide high viscosity products.

Accordingly, it is a primary object of this invention to provide polyimides derived from asymmetrical dianhydrides, namely, 2,3,3',4'-benzophenone dianhydride (a-BTDA) and 3,4'-(hexafluoroisopropylidene) diphthalic anhydride (a-6FDA).

It is another object of this invention to provide a process for preparing polyimides derived from 2,3,3',4'-benzophenonetetracarboxylic acid and 3,4'-(hexafluoroisopropylidene) diphthalic acid and the corresponding asymmetric anhydrides (a-BTDA and a-6FDA).

It is another object of this invention to provide novel processes for the preparation of polyimides derived from a-BTDA and a-6FDA, and the compositions derived from said processes.

It is another object of this invention to provide processes for preparing asymmetrical tetracarboxylic acids and the corresponding dianhydrides (a-BTDA and a-6FDA) useful in producing polyimides having lower-melt viscosities and high glass transition temperatures (Tg).

It is a further object of this invention to provide processes for the preparation of polyimides derived from the synthesis of a-BTDA and a-6FDA obtained by cross-coupling dimethylphenylboronic acid with substituted o-xlenes to produce asymmetric precursors which are further reacted to form the corresponding tetracarboxylic acid and subsequently converted to the corresponding asymmetric dianhydrides.

These and other objects will become more apparent from a further and more detailed description of the invention.

**DETAILED DESCRIPTION OF THE PREFERRED EMBODIMENTS**

Polyimides are derived from dianhydrides illustrated in the reactions in Scheme 1. The asymmetric dianhydrides are obtained by cross-coupling o-xylene derivatives (I) and (II), if (I) is a 3-boron substituted o-xylene, then (II) is a 4-substituted o-xylene, or if (I) is a 4-boron substituted o-xylene, then (II) is a 3-substituted o-xylene derivative. 2,3,3',4'-biphenyl dianhydride (a-BPDA) is prepared by cross-coupling (I) and (II), wherein X is selected from the group consisting of F, Cl, Br, I, OSO₂CF₃, OSO₂CH₃, and Y is (OH)₂, or (OR')₂, where R' is a lower alkyl group such as CH₃, C₂H₅, i-Pr, to form the asymmetrical 2,3,3',4'-tetramethylbiphenyl (III) in a common organic solvent, e.g. toluene, N,N-dimethylformamide (DMF), dimethoxyethane (DFM), 1,4-dioxane, tetrahydrofuran (THF), anisole, or aqueous solution with or without phase transfer catalysts in the presence of palladium or nickel catalysts, either with or without co-catalysts or co-ligands, such as Pd[PPh₃]₄, Pd(OAc)₂, Pd(PPh₃)₂Cl₂, PdCl₂(CH₃CN)₂, Pd(dba)₃/P(t-Bu)₃, Pd₂(dba)₄/[t-Bu]₂, Pd₂(dba)₄/[t-Bu]₂PF₆, NiCl₂(PPh₃)₂, NiCl₂(PCY₃)₂, NiCl₂(dppe), NiCl₂(dppb), and their corresponding polymer bound palladium or nickel catalysts.

Compound (III) is oxidized by potassium permanganate (KMnO₄), chromium trioxide (CrO₃), or by other oxidation methods such as low or high pressure nitric acid oxidation, catalytic oxidation, in air or in oxygen to form the 2,3,3',4'-biphenylytetraacarboxylic acid (IV), which upon dehydration e.g. by acetic anhydride or thermal dehydration, yields 2,3,3',4'-biphenyl dianhydride a-BPDA (V). Alternatively, compounds (I) and (II) are cross-coupled with carbon monoxide in the presence of the Pd or nickel catalysts to form the asymmetrical 2,3,3',4'-tetramethylbiphenylene (VI), which is further oxidized e.g. by KMnO₄, CrO₃, nitric acid oxidation, or with other known catalytic oxidation methods in air or in oxygen to form 2,3,3',4'-benzenetetraacarboxylic acid (VII) which is then dehydrated by acetic anhydride or thermally cyclodehydrated to yield 2,3,3',4'-benzenetetraacarboxylic acid a-BPDA (VIII). Alternatively, 2,3,3',4'-benzenetetraacarboxylic acid (VII) is reduced by hydrazine to form 3,4'-methylenediphthalic acid (IX), which upon dehydration e.g. by acetic anhydride yields 3,4'-methylenediphthalic anhydride (X) a-MPDA.
Scheme I: Synthesis of Asymmetric Dianhydrides from o-Xylene Derivatives

In Scheme II, a similar Suzuki cross-coupling reaction is carried out between 3- or 4-boron-substituted o-xylene (1), boron-substituted phthalic derivative (1a) or boron-substituted phthalic diester (1b), and 4- or 3-halo-substituted phthalic anhydrides, phthalic ester or phthalimides (2), or diesters of phthalic acid respectively, to produce the coupled asymmetrical 4-(2,3-dimethylphenyl)phthalic anhydride, phthalic ester or phthalimide (3). Compound (3) can be hydrolyzed e.g. by potassium hydroxide, followed by oxidation e.g. by KMnO₄, CrO₃ and other oxidizing methods such as low or high pressure nitric acid or with catalytic oxidation in air or oxygen to afford 2,3,3',4'-biphenyl tetracarboxylic acid (5), which upon dehydration e.g. with acetic anhydride or thermal cyclodehydration to yield 2,3,3',4'-biphenyl dianhydride (α-BPDA). In the presence of carbon monoxide gas, 2,3,3',4'-benzophenone dianhydride (10), (α-BTDA) is produced by similar routes from compounds (1) and (2) via compounds (7), (8) and (9) as shown in this reaction.

Alternatively, 2,3,3',4'-benzophenonetetra carboxylic acid (9) is obtained through KMnO₄ oxidation of (2,3-dimethylphenyl)-α-methylphthalic acid (12) after hydrolysis or from the corresponding phthalimide (11) via the Suzuki coupling of an o-xylene derivative (1) with α-halomethylphthalic anhydride or α-halomethylphthalimide (2) with palladium or nickel catalysts. 2,3,3',4'-benzophenone tetracarboxylic acid (9) can be reduced by hydrazine to 3,4'-methylenediphtalic acid.

In the cross-coupling reactions, X is selected from the group consisting of a halogen e.g. Cl, F, Br, I, or OS\_0\_2CF\_3 and OS\_0\_2CH\_3. Y is either (OH)\_2 or (OR')\_2. Z is either oxygen or nitrogen. R is —CH\_2——C==O, or nil. R' is a lower alkyl such as CH\_3, or C\_2H\_5, and B is boron.

The dianhydrides prepared by these processes are particularly useful in preparing polyimides from one or more of a combination of reactants comprising dianhydrides selected from the group consisting of 2,3,3',4'-biphenyldianhydride (a-BPDA), 2,3,3',4'-benzophenone dianhydride (a-BTDA), and 3,4'-methylene diphthalic anhydride (a-MDPA), with at least one multifunctional amine such as diamines and an endcap that can be melt-processed at temperatures between 232-270° C. (450-520° F.), without any solvent. The imide oligomers of this reaction have low-melt viscosities of 1-60 poise at 260-280° C. These imide oligomers are amenable to TRM, VARTM or resin infusion processes at 260-280° C. to product high quality polymer composites comprising carbon, glass, quartz or synthetic fibers for use at temperatures ranging up to about 550° to 650° F.

The preferred polyimides of this invention are derived from anhydrides specifically illustrated in Schemes III and IV, which provides novel processes for preparing asymmetrical 2,3,3',4'-benzophenone dianhydride (a-BTDA) and asymmetrical 3,4'-(hexafluoropropylidene)diphthalic anhy-
dride (a-6FDA) without the complicated process of separating isomers. The 2,3,3',4'-benzophenone dianhydride (a-BTDA) is prepared by employing the cross-coupling of specific pair of dimethylphenylboronic acid with a mixed anhydride of dimethylbenzoic acid, generated in situ or prepared externally, to obtain the intermediate 2,3,3',4'-tetramethylbenzophenone (4). The mixed dianhydride can be prepared by reacting 3,4-dimethylbenzoic acid or 2,3-dimethylbenzoic acid with either a dialkyl dicarbonate, alkyl chloroformate, alkyl acid halides (acid chloride preferred) or alkyl dianhydrides where the alkyl groups includes primary, secondary and tertiary alkyl groups of C<sub>1</sub>-C<sub>6</sub>. The catalysts for the cross-coupling reaction includes, but is not limited to Pd(PPh<sub>3</sub>)<sub>4</sub>, Pd(PPh<sub>3</sub>)<sub>2</sub>Cl<sub>2</sub>, Pd(PCY<sub>3</sub>)<sub>2</sub>, Pd(OAc)<sub>2</sub>, PdCl<sub>2</sub> (CH<sub>3</sub>CN), and Pd(dba)<sub>2</sub>(t-Bu)<sub>2</sub>. The co-catalysts or co-ligands include but not limited to PPh<sub>3</sub>, PCY<sub>3</sub>, P(p-MeOC<sub>6</sub>H<sub>4</sub>)<sub>3</sub>, P(o-Tol)<sub>3</sub>, and 1,1'-bis(diphenylphosphino)ferrocene (DPPF). Other additives used in the cross-coupling reaction can include water, NaI, NaF, Na<sub>2</sub>CO<sub>3</sub>, KI, KF, K<sub>2</sub>CO<sub>3</sub>, K<sub>3</sub>PO<sub>4</sub> and N,N'-dicyclohexylcarbodiimide (DCC).

The 2,3,3',4'-tetramethylbenzophenone is reacted with trifluoromethyldimethylsilane CF₃Si(CH₃)₃ and further converted to 3,4'-(hexafluoroisopropylidene)bis-o-xylene (8). Alternatively, 3,4'-(hexafluoroisopropylidene)bis-o-xylene (8) is also prepared from two different routes as shown in Scheme IV. A) Via the coupling of either 2-(3,4-dimethylphenyl)-hexafluoro-2-propanol (a) or 2-(2,3-dimethylphenyl)-hexafluoro-2-propanol (b) with respective trialkylsilane derivatives of o-xylene (c) and (d). B) By converting (a) and (b) to their corresponding halides (e) and (f) and then coupled with 3- or 4-substituted o-xylene.

The 2,3,3',4'-tetramethylbenzophenone (4) and 3,4'-(hexafluoroisopropylidene)bis-o-xylene (8) are oxidized by potassium permanganate (KMnO₄), chromium trioxide (CrO₃), or by other oxidation methods, such as nitric acid oxidation, or catalytic oxidation in air or oxygen in the presence of catalysts to obtain the corresponding 2,3,3',4'-benzophenone tetracarboxylic acid (5) and 3,4'-(hexafluoroisopropylidene)diphthalic acid (9), respectively. The tetracarboxylic acids (5) and (9) are subsequently reacted either with acetic anhydride or propionic dianhydride, or thermally cyclodehydrated to obtain the corresponding 2,3,3',4'-benzophenone dianhydride (a-BTDA) or 3,4'-(hexafluoroisopropylidene)diphthalic anhydride (a-6FDA).

The thermoplastic polyimides of this invention are prepared from dianhydrides or the ester-acid derivatives thereof selected from the group consisting essentially of:

\[
\begin{align*}
\text{(a)} & \quad O \quad Z \quad O \\
\text{(b)} & \quad R_2O \quad OHO \\
\end{align*}
\]

with at least one multifunctional amine, e.g. diamines, in the equivalent stoichiometric ratio or an excess of either the dianhydride or the amine in solvents, such as N-methyl-2-pyrrolidone (NMP) to form polyamic-acid intermediate, which are then cyclodehydrated at temperatures between 120-200°C to thermoplastic polyimides having the formula:
wherein Z is (CF₃)₂C—O, R is a lower alkyl of 1-6 carbons, B is a dianhydride or its acid-ester derivative other than the dianhydrides (a) or (b) as shown in the above formulas, (BA)ₙ is the product of B and A, n is equal to 1-100, m is equal to 0-100, and when m=0, it is a homopolymer, and when m is greater than 0, it is a copolymer.

In the above formulas, A is a diamine containing an organic divalent'radical consisting of aliphatic, cycloaliphatic, heterocyclic, siloxane, or aromatic groups linked through bridging atoms or groups. The preferred structure of A is selected from the group consisting essentially of

EXAMPLE 1

Synthesis of 2,3,3',4'-tetramethylbenzophenone (4)

To a 250 ml 3-necked round-bottom flask, 2,3-dimethylphenylboronic acid (3.6 g, 24 mmol), 3,4-dimethylbenzoic acid (3.0 g, 20 mmol), a selected palladium catalyst (0.6 mmol), dimethyl dicarbonate (2.7 g, 30 mmol) and potassium carbonate (6.22 g, 45 mmol) were mixed with 150 ml of dry dioxane. The reaction mixture was heated at 80°C overnight to become a viscous reaction mixture. 20 ml of water was added to dissolve the heterogeneous reaction mixture, and dioxane was evaporated to dryness. The aqueous solution was extracted with 20 ml of ethyl acetate, dried over anhydrous magnesium sulfate and then evaporated to dryness. The crude
product was purified by silica gel column chromatography eluted by hexane/ethyl acetate–20/80 to afford 2.0 g (33%) of the product.

**Synthesis of 2,3,3',4'-benzophenonetetraacrylic acid (5)**

2,3,3',4'-tetramethylbenzophenone (2.0 g, 8.4 mmol) and potassium permanganate (5.3 g, 33.6 mmol) were mixed in 25 ml of water in a 100 ml round-bottom flask and the reaction mixture turned purple. The reaction mixture was heated at 90°C overnight. The reaction mixture was cooled down to room temperature, and the aqueous solution was evaporated to dryness to afford 2.5 g (90%) of the desired tetraacid.

**Synthesis of Thermoplastic Polyimides**

**EXAMPLE 2**

A solution of 2,3,3',4'-benzophenonetetraacrylic acid (3.22 g, 10 mmol) and 2,2-bis(4-aminophenyl)hexafluoropropane anhydride (4.44 g, 10 mmol) in 31 g of dry N-methyl-2-pyrrolidinone (NMP) were stirred at room temperature under nitrogen overnight. A mixture of 3,4'-(hexafluoroisopropylidene)dipthalic anhydride (17.99 g) and 4-phenylethynylphthalic anhydride (2.23 g) in 24.32 g of absolute ethanol was heated to reflux for 1 hour to form the corresponding diester diacid solution. After cooling the solution down to room temperature, 20.37 g of 4,4'-methylenedianiline (11.76 g) in 10 g of methanol was added. The solution was concentrated to dryness in a hot plate and then aged at 90°C for 1 hour to afford a polyimide powder.

**EXAMPLE 3**

A solution of 2,3,3',4'-benzophenonetetracarboxylic acid (5) (3.7 g, 10 mmol) was suspended in minimum amount of acetic anhydride; (3 g, 2.7 ml) and heated to reflux for 4 hours. The reaction mixture was cooled to room temperature. The corresponding diacidric acid precipitated out and was collected and washed with ether to remove trace of acetic acid before drying under vacuum to afford 2.9 g (90%) of a-BTDA.

**EXAMPLE 4**

A solution of 3,4'-oxydianiline (4.86 g) in 4.86 g of ethanol was added at room temperature to form a 50% solution. The resulting 50% monomer solution was used as paint onto unidirectional carbon fibers or fabrics. The prepregs were allowed to be air-dried. The polyimide prepregs can be staged at 150°C and then cured at 315°C for 2 hours to form the polyimide carbon fiber composites.

**EXAMPLE 5**

A solution of 2,3,3',4'-benzophenone dianhydride (12.88 g) and 4-phenylethynylphthalic anhydride (9.92 g) in 26.64 g of methanol were heated to reflux for 1 hour to make a 50% solution of the corresponding diester diacid. After cooling the solution down to room temperature, 20.37 g of 4,4'-methylenedianiline in 20.37 g of methanol was mixed with the diester diacid solution with stirring. The resulting 50% monomer solution was poured into unidirectional carbon fibers or fabrics. The prepregs were allowed to be air-dried. The polyimide prepregs can be staged at 150°C and then cured at 315°C for 2 hours to form the polyimide carbon fiber composites.

**EXAMPLE 6**

A solution of 3,4'-(hexafluoroisopropylidene)dipthalic anhydride (22.17 g) and naphthalimide anhydride (10.93 g) in 6.68 g of methanol was heated to reflux for 1 hour to make a 50% solution of the corresponding diester diacid. After cooling the solution down to room temperature, 20.37 g of 4,4'-methylenedianiline in 20.37 g of methanol was mixed with the diester diacid solution with stirring. The resulting 50% monomer solution was used as paint onto unidirectional carbon fibers or fabrics. The prepregs were allowed to be air-dried. The polyimide prepregs can be staged at 150°C and then cured at 315°C for 2 hours to form the polyimide carbon fiber composites.

**EXAMPLE 7**

A solution of 3,4'-oxydianiline (8.88 g), 4-phenylethynylphthalic anhydride (9.92 g) and 3,4'-oxydianiline (8.0 g) were mixed well and then the reaction mixture was heated in an oven at between 200-280°C for 1 hour to melt all the monomers into forming a polyimide prepreg with low-melt viscosity (10-30 poise). The low-melt resins can be injected into carbon fiber prepreg by resin transfer molding (RTM), vacuum assisted resin transfer molding (VARTM) or resin infusion process to form lightweight carbon fiber composites.

While this invention has been described by a number of specific examples, it is obvious that there are other variation and modification that can be made without departing from the spirit and scope of the invention as set forth in the appended claims.

The invention claimed is:

1. Thermoplastic polyimides derived from asymmetric dianhydrides or the ester-acid derivatives thereof selected from the group comprising of:

![Diagram](attachment:diagram.png)

(a)
R is a lower alkyl radical having 1 to 6 carbon, A is a divalent organic radical of a diamine (H2N-A-NH2), (BA)n is the reaction product of dianhydride B or its ester acid derivative with a diamine (H2N-A-NH2), n has the value of 1-100, and m has the value of 1-100.

2. The polyimides of claim 1 wherein at least one of the multifunctional amines is a diamine wherein the diamine and dianhydride is in a stoichiometric ratio of 1 to 1.

3. The polyimides of claim 1 wherein at least one of the multifunctional amines is a diamine wherein the diamine or dianhydride is in excess of the stoichiometric ratio.

4. The polyimides of claim 2 wherein the diamine (H2N-A-NH2) contains an organic divalent radical A, consisting of aliphatic, cycloaliphatic, heterocyclic, siloxane, or aromatic groups linked through bridging atoms or groups.

5. Polyimides of claim 4 wherein the structure of divalent radical A is selected from the group consisting of:

wherein Z is C(CF3)2, which correspond to the following polyimide structures consisting of:

wherein B is a second dianhydride or its ester acid derivative other than (a) and (b), consisting of:
23 -continued

wherein R₁ and R₂ are alkyl groups, and R₃ is an alkyl, alkoxy, halogen, CF₃, phenyl or phenoxy group.

6. Polyimide derived from asymmetric dianhydrides and the ester-acid derivatives of said dianhydride selected from the group of:

and a second dianhydride B or its ester-acid derivatives other than (a) and (b) and consisting of:

with at least one multifunctional amine, and a terminal endcap to form polyimide having a formula selected from the group consisting of:

endcap

and

endcap

7. The polyimides of claim 5 wherein the terminal monofunctional endcap is selected from the group consisting of:
wherein R is low alkyl of 1-6 carbon, and R'' is an alkyl, alkoxy, halogen.

8. The polyimides of claim 6 wherein the diamine (H₂N-A-NH₂) contains an organic divalent radical Z, consisting of aliphatic, cycloaliphatic, heterocyclic, siloxane, or aromatic groups linked through bridging atoms or groups.

9. Polyimides of claim 8 wherein the structure of divalent radical A is selected from the group consisting of:

10. The polyimide of claim 7 wherein at least one the multifunctional amines is a diamine, and either the diamine or dianhydride is in excess of the stoichiometric ratio.

11. The polyimides of claim 6 wherein the polymer is a copolymer having the formula:

wherein when x is zero, y is one; and when x is one y is zero.
