Technology Development Drivers as we thought!!

Government investments have been leading to Commercialization

- Space Travel
- Space Exploration
- Communication
- Computational
- Remote Sensing

Human dimension

Science

So what is driving it now – science or economic market??

Is public interest slowing down??

And Tax payers/legislatures want technology development must have specific end users i.e., beneficiaries
Science – Astrophysics from L2

Science will still offer major breakthroughs
Our Challenge in this century will be learning and adapting to Climate Change

Earth System Science
…..and will be dealing with multiple societal issues
• The concentration of CO₂ in the atmosphere has reached a record high
Aqua Mid-Tropospheric CO$_2$ Product

Ocean Thermohaline Circulation -
The Great Conveyor Belt
Orbital variations are producing changes in the seasonal and latitudinal distribution of incoming solar radiation at the top of the atmosphere.

Slow variations of the Earth’s orbit are induced by gravitational torque by other planets, mainly Jupiter, Saturn, and Venus.

**Orbital Variation**

**The Three Ways Earth's Orbit Changes**

- Eccentricity: (100,000 and 400,000 yrs)
- Precession: (19,000 and 23,000 yrs)
- Tilt: (41,000 yrs)
Feedbacks in Climate System

- Temperature increases
- Sea ice is reduced
- Wet snow
- Melting ice
- Reduced surface albedo
- More energy absorbed
- Temperature increases
- More sea ice reduction
Overarching Questions

How does the Earth work?
How is the Earth changing?
Are human activities altering the chemical composition of the planet?
How does our changing environment affect life on Earth?

Forces acting on the Earth system
Earth system responses

Climate Modeling Research

Initial conditions → Global Climate Models → Validation → Analyses and Predictions

Global Climate Models → Regional Climate Analysis → Satellite observations

Regional Climate Analysis → Assessments and Predictions

Satellite observations → Long term in situ observations

Earth System integrated analyses, monitoring and predictions
What Earth Science can Contribute

- **Understand and Develop**: Study the past, observe the present, and predict the future
- **Technology**: Develop technology by defining new measurement requirements to address unknowns
- **Utilize**: Apply results to address societal needs
Addressing societal issues

- Agriculture
- Disasters
- Air Quality
- Health
- Oceans
- Water Resources
- Weather
Flood Mapping and Modeling
How different was 2010?

Once again, the year 2010 showed the world the devastating impact that natural disasters can have on human lives and livelihoods. After the relatively moderate year of 2009, natural disaster impact took a turn for the worse in 2010 with more than 297,000 fatalities. One must note that trends and patterns in disaster statistics are often greatly altered by single extreme events causing excessive loss and damage, such as the earthquake and tsunami in Japan. Over the last four decades, the mortality figures of 2010 were only surpassed in 1970, when a tropical cyclone affected the African continent and caused 450,000 deaths.

In 2010, 42 more disasters were reported than in 2009. The number of reported disasters (385) approximated the average yearly disaster occurrence from 2000 to 2009 (387). Although the total number of reported disasters in 2010 approached the 2000 annual average of disaster occurrence, a slight change was seen in the distribution between disaster subgroups. Mostly, hydrological disaster occurrence increased whereas meteorological disaster occurrence decreased, hereby enlarging the share of hydrological disasters in 2010.

The number of victims increased from 198.7 million in 2009 to 217.3 million in 2010 but remained below the annual average number of victims of 227.5 million for the period 2000 to 2009. The number of victims from hydrological disasters increased by 98.9% compared to the yearly average of the last decade. In contrast, climatological, meteorological and to a lesser extent geophysical disasters decreased.

Figure 7: Natural disaster impacts by disaster subgroup: 2010 versus 2000-2009 annual average

Near Real-Time TRMM Multi-Satellite Precipitation (TMPA-RT) 3-hourly product

* TRMM used to calibrated all other satellites

Huffman/NASA GSFC
65° inclination, non sun-synchronous orbit, mean altitude of 407 km
- Precipitation physics observatory
- Reference standard for inter-satellite calibration of constellation sensors

Radar: 1.26 GHz
Radiometer: 1.4 GHz
Antenna swath: 1,000 km
Resolution: 40 km radiometer and 3 km radar
On-line Global Flood Modeling

Real-time global estimation of flood areas using satellite-based rainfall and a hydrological model running globally, every three hours at 0.25°.

Estimated Water Depth from Hydrological Model
- 35mm: Flood Potential
- 75mm: Flooding
- >125mm: Severe

http://trmm.gsfc.nasa.gov

Adler/Policelli UMD/NASA GSFC
Flood potential for Lake Victoria Region (Kenya, Tanzania and Uganda) – home to 30 million people and over 175,000 are effected due to devastating floods

Using 1KM DEM
Water as a sustainable resource
HKH Region with Major River Basins
• Enhance the decision making capacity of ICIMOD and its member countries for management of water resources (floods and irrigation) in the short (snow, rainfall) and the long-term (glaciers)

• Integrate snow and glaciers outflow to primary river basins (Ganges, Indus and Brahmaputra)
  - Provide a methodology that allows the snow extent with glacier maps to determine water outflow from melting glaciers using mass balance equations

• Explore the impact of climate change scenarios on water resources in the Himalayan region using hydrological models.

Benefits
• Provide an integrated decision support capability incorporating snow, glacier and ice melt water in stream flow models for hydrological managers

• Develop understanding of glacier physics

- 118 new scenes acquired in over the Himalayas
- total Himalayan scenes in the GLIMS database: 4830
The line or zone on glacier’s surface where a year’s ablation balances year’s accumulation. It is determined at the end of the ablation season, and commonly occurs at the boundary between superimposed ice and glacier ice.
GRACE Reveals Massive Depletion of Groundwater in NW India

The water table is declining at an average rate of 33 cm/yr

GRACE is unique among Earth observing missions in its ability to monitor variations in all water stored on land, down to the deepest aquifers.

During the study period, 2002-08, 109 km$^3$ of groundwater was lost from the states of Rajasthan, Punjab, and Haryana; triple the capacity of Lake Mead.
Middle East & North Africa (MENA) NASA Land Data Assimilation System (LDAS) for Regional Water Balance Assessments

- NASA is partnering with USAID to develop a Land Data Assimilation System for the MENA, which will provide regional water balance assessments to address:
  - water availability, 1/8 degree resolution
  - water and agriculture variability
  - aquifer monitoring

- World Bank has approved a Global Environment Fund (GEF) Regional Grant under the Mediterranean Sustainable Development Program to extend the MENA LDAS to multiple regionally-focused NASA based water data platforms strategically located through the MENA.
  - Negotiations are underway to engage NASA and USAID in this process

Precipitation (mm/month) for July 2007 at 0.04° resolution, from the UC Irvine PERSIANN-GCCS system. Hourly, near-real time data from PERSIANN will be a primary input to the MENA LDAS.

Mean evapotranspiration rate (mm/day) from the MENA LDAS for April, 2006.

Rodell, Bolten, Toll, Habib /GSFC, Kumar, Engman GSFC/SAIC, Ozdogan/UW, Zaitchik/JHU
Summary

• Significant advances have been made by several nations in space technology for exploration, sciences and travel

• Now, the era has begun to commercialize space travel.
  – Space orbital debris will continue to be a big challenge

• Science must continue to drive the technology development

• Partnering and Data Sharing among nations is very important to maximize the cost benefits of such investments

• Climate changes and adaptability will be a big challenge for the next several decades
  – Natural disasters frequency and locations
  – Economic and social impact can be global
  – Water resources and management
