Overview

- Motivation and applications
- Multiscale materials modeling
- Atomic structure
- Interatomic potentials
- Simulations of lattice thermal conductivity for ZrB$_2$ and HfB$_2$
- Comparison to experiments
**UHTC for Sharp Leading Edges**

*Sharp leading edge for hypersonic aircraft*
- Enhances vehicle performance
- Improves safety

*Higher temperature requirements*
- Shuttle RCC leading edge: T~1650°C
- Sharp leading edged vehicles: T>2000°C

*UHTC advantages for sharp leading edges*
- Good mechanical properties
- Oxidation resistance
- *High thermal conductivity*
  - Effective thermal radiation
  - Thermal shock resistance

Multiscale Modeling of UHTC

- Framework integrates three methods
- Multiscale framework for ZrB$_2$ and HfB$_2$:
  - *Ab initio* – fundamental chemistry, electronic structure impact on basic material properties
  - *Atomistic* – thermal/mechanical properties, adhesion and thermal resistance of grain boundaries, fracture
  - *Continuum* – macro properties, thermal/mechanical analysis of microstructure

- **This talk focuses on atomistic methods**
  - Development of interatomic potentials
  - Lattice thermal conductivity simulations
  - Other topics presented elsewhere

JL, Daw, Squire and Bauschlicher, (2012), submitted
Atomic Structure: ZrB$_2$ and HfB$_2$

Alternating layers of Zr/Hf (red) and Boron (gray)

Graphitic Boron layers with Zr/Hf over each ring
Fundamental Properties: ZrB$_2$ & HfB$_2$

**Electronic Spectra**

- Electronic properties essentially identical

**Vibrational Spectra**

- Acoustic modes carry heat.
- Optical modes are resistive.

Tersoff Bond Order Potential

**Two body terms** \((A, \lambda, B, \mu)\) energy

\[
E = \sum_{i \neq j} \left[ f_R^{[ij]}(d_{ij}) + b_{ij} f_A^{[ij]}(d_{ij}) \right]
\]

\[
f_R^{[ij]}(d) = A_{ij} \exp(-\lambda_{ij}d)
\]

\[
f_A^{[ij]}(d) = -B_{ij} \exp(-\mu_{ij}d)
\]

**Bond order** \((\beta, \lambda_3, n, m)\)

\[
b_{ij} = (1 + \beta_{ij}^{n_i} \zeta_{ij}^{n_i})^{-\frac{1}{2n_i}}
\]

\[
\zeta_{ij} = \sum_{k \neq i,j} f_C^{[ij]}(r_{ik}) \gamma_{ijk} g_i(\theta_{ijk}) \exp[\lambda_{3i}(d_{ij} - d_{ik})^m]
\]

**Angular function** \((c, d, h)\)

\[
g_i(\theta) = 1 + c_i^2 / d_i^2 - c_i^2 / (d_i^2 + (h_i - \cos \theta)^2)
\]

Daw, JL and Bauschlicher, Comp. Mat. Sci., (2011)
First Step: Zr Potential

- Zr potential exists
- Developed new Zr potential
- Fit to *ab initio* database of crystal structures

Third Step: ZrB₂ Potentials

- Zr-Zr parameters fixed
- B-B parameters fixed
- Zr-B fit to small database
- Pot A = “new Zr” + B
- Pot B = WM2 + B
- **Will Boron planes stay flat?**

### Fitting Results

Stable, multilayered system with **flat, hexagonal** Boron sheets!
Lattice Thermal Conductivity

• Green-Kubo thermal conductivity tensor

\[ \kappa_{\mu \nu} = \frac{1}{V k_B T^2} \int_0^\infty \langle J_{\mu}(\tau) J_{\nu}(0) \rangle d\tau \]

• Heat current \( J(x_i, v_i) \), energy \( e_i \), stress-tensor \( S_i \)

\[
J = \frac{1}{V} \left[ \sum_i e_i v_i - \sum_i S_i v_i \right]
\]

\[
J = \frac{1}{V} \left[ \sum_i e_i v_i + \frac{1}{2} \sum_{i<j} (f_{ij} \cdot (v_i + v_j)) \cdot x_{ij} \right]
\]

• Monoatomic systems (e.g. Si) have monoatomic decay
• ZrB$_2$ has longer period than HfB$_2$ at T=300K
• ZrB$_2$ at T=1000K has longer period than T=300K
Correlation Function Power Spectra

- Correlations oscillate with metal-B optical modes
- $C_{xx}$ and $C_{yy}$ oscillate with in-plane mode frequency
- $C_{zz}$ oscillates with out-of-plane mode frequency
Lattice Thermal Conductivity: ZrB$_2$

- 8 independent, 10 ns simulations, $T=300K$
- 8x8x16 unit cell, 12,255 atoms
- $\kappa_{xx} = 60$ W/(m.K), $\kappa_{zz} = 40$ W/(m.K)
Lattice Thermal Conductivity: HfB$_2$

- 8 independent, 10 ns simulations
- 8x8x16 unit cell (12 atoms) = 12,255 atoms
- $\kappa_{xx} = 76$ W/(m.K), $\kappa_{zz} = 65$ W/(m.K)
Thermal Conductivity vs Temperature

- 8 independent, 10 ns simulations for each point
- Data fit to 1/T curves
Experimental Data Comparison

- **Polycrystalline ZrB$_2$**
  - $\kappa_e = 33$ W/mK, $\kappa_{lat} = 22$ W/mK
  - $\kappa_{lat} \sim 0.3\kappa_{tot}$
- **Single crystal ZrB$_2$**
  - $\kappa_{xx} = 140$ W/mK, $\kappa_{zz} = 100$ W/mK
  - 1 sample, 1 measurement
  - defects uncharacterized
  - $\kappa_{xx} = 45$ W/mK , $\kappa_{zz} = 30$ W/mK
- Data needed for ZrB$_2$ and HfB$_2$
- **Simulation data reasonable at 300K but too low for higher T**

\[ K = K_e + K_{lat} \]

Conclusions

• Atomistic simulations for ZrB$_2$ and HfB$_2$:
  • Developed first interatomic potentials for UTHC
  • Lattice thermal conductivity using Green-Kubo formalism
  • Heat current correlation function oscillations
  • Thermal conductivity versus temperature
  • Reasonable agreement with experiment

• Modeling unanswered questions:
  • Interatomic potential fidelity
  • Lattice TC without potentials (\textit{ab initio}, Boltzmann,…)
  • Conducting versus resistive vibrational modes
  • Isotope and defect effects
  • Interface thermal resistance: grain boundaries *

• Experimental unanswered questions:
  • Single crystal characterization and thermal conductivity
  • Electronic versus lattice thermal conductivity

* JL, Daw, Squire and Bauschlicher, (2012), submitted

Test Results

VASP = \textit{ab initio} code
Physics of Lattice Thermal Conductivity

• $\kappa = \rho C_\nu l_{\text{mfp}}$
  • scattering restricts $l_{\text{mfp}}$

• **Region I**: $\kappa \sim T^3$
  • dilute phonons
  • boundary scattering
  • quantum statistics

• **Region II**: $\kappa_{\text{max}}$

• **Region III**: $\kappa \sim 1/T$
  • high phonon density
  • phonon, pt. defect scattering

• **Region IV**: $\kappa_{\text{min}}$, $l_{\text{mfp}} = \text{“a”}$

Summary

- No atomistic simulations for $ZrB_2$ due to lack interatomic potentials
- Potentials are prerequisite for atomistic simulations of *mechanical* and *thermal* properties
- We developed such potentials for ZrB$_2$
- $ZrB_2$ potentials give stable structures with flat, hexagonal $B$ planes
- We performed the first atomistic simulations for these materials
- Lattice thermal conductivity was evaluated for single crystals
- Reasonable agreement with experiments

**Future/current work:**
- Grain boundaries: energetics and thermal interface resistance
- Integration into multiscale framework
- Potentials and applications for Hf and HfB$_2$
