This book gives a much needed explanation of the basic physical principles of radiative transfer and remote sensing, and presents all the instruments and retrieval algorithms in a homogenous manner. For the first time, an easy path from theory to practical algorithms is available in one easily accessible volume, making the connection between theoretical radiative transfer and individual practical solutions to retrieve aerosol information from remote sensing. In addition, the specifics and intercomparison of all current and historical retrieval methods are explained and clarified.

Aerosol Remote Sensing:

- introduces the field of aerosol research and remote sensing;
- comprehensively explains the basic principles of radiative transfer and remote sensing;
- presents the various instruments and the inversion algorithms in a homogenous manner;
- covers passive (shortwave and longwave) and active methods;
- connects theoretical radiative transfer with individual practical solutions;
- gives the specifics and intercomparison of all current and historical retrieval methods.
Table of contents

Chapter 1. Introduction

*Jacqueline Lenoble, Lorraine Remer, Didier Tanré.*

1.1. What are aerosols?
1.2. Why are we interested in aerosols?
1.3. How can we observe aerosols?
1.4. Objective and organization of the book.

Chapter 2. Absorption and scattering by molecules and small particles

*Jacqueline Lenoble, Michael I. Mishchenko, Maurice Herman.*

2.1. Introduction.
2.2. Atmospheric molecular absorption.
2.3. Definitions: extinction, scattering, absorption, and phase function.
2.4. Polarization and scattering matrix.
2.5. Molecular scattering: Rayleigh theory.
2.6. Lorentz-Mie theory.
2.8. Illustrative theoretical and laboratory results.

Chapter 3. Radiative transfer in the Earth’s atmosphere

*Jacqueline Lenoble, Maurice Herman.*

3.1. Introduction.
3.2. The scalar and the vector equations of transfer.
   3.2.1. The scalar equation of radiative transfer.
   3.2.2. Formalism for a plane-parallel atmosphere.
   3.2.3. The vector equation of transfer.
   3.2.4. Expansion into Fourier series of azimuth.
3.3. Boundary conditions.

3.4. Solution of the radiative transfer problem.
   3.4.1. Successive orders of scattering (OS)
   3.4.2. Discrete ordinates (DISORT)
   3.4.3. Adding-Doubling method.
   3.4.4. Monte Carlo method.
   3.4.5. Approximate methods.

3.5. Radiative transfer codes.

3.6. Examples of aerosol impact.
   3.6.1. Ground based observations.
   3.6.2. Space borne measurements.

3.7. Summary.

Chapter 4. Direct observation of the sun for aerosol retrieval.
Colette Brogniez, Jacqueline Lenoble, Glenn Shaw.
   4.1. Introduction.
   4.2. Ground based sunphotometry.
   4.3. Occultation methods.
   4.4. Conclusion.

Chapter 5. Determination of aerosol optical properties from inverse methods.
Michael D. King, Oleg Dubovik.
   5.1. Introduction.
   5.2. Diffuse and direct solar radiation.
      5.2.1. Spectral aerosol optical thickness.
      5.2.2. Sky radiance as a function of scattering angle.
   5.3. Basic inversion of linear systems.
      5.3.1. Direct inversion.
      5.3.2. Least-squares solution.
5.3.3. Uniqueness and the nature of a priori constraints.

5.3.4. Measures of smoothness.

5.3.5. Constrained linear inversion.

5.3.6. Selection of the Lagrange multiplier.

5.3.7. Solution covariance matrix.

5.4. Inversion of aerosol size distribution from spectral optical thickness measurements.

5.5. Combination of observations and multi-term LSM solution.

5.6. Non-negativity constraints.

5.7. Smoothness constraints in the case of retrieval of characteristics with nonuniformly spaced ordinates.

5.8. Inversion of aerosol size distribution and single scattering albedo from spectral optical thickness and sky radiance measurements.

Chapter 6. Passive shortwave remote sensing from the ground.

Glenn E. Shaw, Brent N. Holben, Lorraine A. Remer.

6.1. Introduction.

6.2. Early history.

6.3. The Smithsonian programme.

6.4. Early turbidity measurements.

6.5. Technological advances.

6.6. BAPMON, the satellite era and prototypes of the modern networks.

6.7. AERONET and other modern networks.

6.9. Examples of science from ground-based remote sensing.

6.10. Summary.

Chapter 7. History of passive remote sensing of aerosol from space.

Omar Torres, Lorraine A. Remer.

7.1. First observations from space.

7.3. El Chichon and Pinatubo volcanic eruptions.

7.4. Total column aerosol retrieval from reflected visible and near IR observations

7.4.1. Retrieval of aerosols over the oceans using the dark target approach.

7.4.2. Retrieval of aerosols over land using the dark target approach.

7.4.3. Retrieval of aerosols over land using the adjacency effect.

7.5. Aerosol remote sensing using near UV observations.

7.5.1. The UV aerosol index.

7.5.2. Aerosol index properties.

7.5.3. Benchmark aerosol events.

7.5.4. Application to other sensors.

7.5.5. Quantitative use of near-UV observations.

7.6. Multiangle, polarization and geosynchronous capabilities.

7.6.1. Multiangle.

7.6.2. Polarization.

7.6.3. Retrievals from geosynchronous satellites.

7.7. Summary.

Chapter 8. Recent instruments and algorithms for passive shortwave remote sensing.

Lorraine A Remer, Colette Brogniez, Brian Cairns, N Christina Hsu, Ralph Kahn, Piet Stammes, Didier Tanre, Omar Torres.

8.1. Introduction.

8.2. SAGE(s)-POAM(s). Occultation instruments.

8.2.1. Mission and instrument descriptions.

8.2.2. Size distribution retrieval and derived products.

8.3. MODIS/AQUA/terra.

8.3.1. Mission and instrument descriptions.

8.3.2. Algorithm description.

8.3.3. Data use consideration.

8.4. MISR/terra.
8.4.1. Mission and instrument descriptions.
8.4.2. Algorithm description.

8.5. POLDER/PARASOL.
  8.5.1. Mission and instrument descriptions.
  8.5.2. Algorithm description.
  8.5.3. Advanced POLDER retrieval.

8.6. OMI/AURA.
  8.6.1. Mission and instrument descriptions.
  8.6.2. Algorithm description.
    8.6.2.1. Near UV aerosol algorithm (OMAERUV)
    8.6.2.2. Multi-wavelength aerosol algorithm (OMAERO)

8.7. GOME-SCHIAMACHY.
  8.7.1. Instrument description.
  8.7.2. Algorithm description and limitations

8.8. APS.
  8.8.1. Instrument description.

8.9. Advances in remote sensing of aerosol using modern sensors.
  8.9.1. Aerosol retrieval over clouds.
  8.9.2. The MAIAC retrieval.
  8.9.4. Aerosol plume heights.
  8.9.5. Advances using combination of sensors or sensors and models.

8.10. Summary.

Chapter 9. Longwave passive remote sensing.

Clémence Pierangelo, Contributions: Alain Chédin, Michel Legrand.

9.1. Introduction.

9.2. Aerosol optical properties in the logwave domain.
9.2.1. On the relative impact of aerosol species in the infrared.
9.2.2. Effect of refractive indices (or composition).
9.2.3. Effect of size distribution.
9.2.4. Effect of particle shape.
9.2.5. Summary.
9.3. The radiative transfer equation in the thermal infrared range.
9.3.1. The RTE in an aerosol free atmosphere.
9.3.2. The data required as input for a gaseous atmosphere.
9.3.3. The particular case of RTE in an atmosphere containing non-scattering aerosol.
9.3.4. The RTE with scattering processes.
9.3.5. Solving the RTE.
9.3.6. Aerosol effect on the longwave spectrum.
9.4. Inversion principles.
9.4.1. Useful spectral domain.
9.4.2. Preliminary steps.
9.4.3. Detecting aerosols.
9.4.4. Direct retrieval.
9.4.5. Physical retrieval.
9.4.6. Look-Up-Table retrieval.
9.4.7. Specificities of a retrieval algorithm over land.
9.4.8. Validating and comparing the results.
9.5. Illustrations.
9.5.1. Space observations.
9.5.2. Ground based observations.

Chapter 10. Active lidar remote sensing.

M. Patrick McCormick, Kevin R. Leaver.

10.1. Introduction.
10.2. Aerosols and elastic backscatter.
10.3. DIAL.
10.4. Raman.
10.5. HSRL.
10.6. Depolarization.
10.7. Lidar networks.
10.8. Spacebased lidar.
10.9. Summary.

Chapter 11. Conclusion. Results and suggestions for future research.

*Jacqueline Lenoble, Lorraine Remer, Didier Tanrè.*

11.2. Results.
11.3. Algorithms vs. products. Validation vs. intercomparison.
11.4. Recommendations for future work.
