‘Fliegen Sie das Teleskop’

Troy Asher
Steve Cumming
Agenda

• A brief SOFIA overview
• Review of Open Cavities in Flight
• SOFIA Cavity / Door Design
• Flight Test Approach / Managing Test Points
• Flight Test Results
• SOFIA in Action
• Conclusions and Lessons Learned
Program Objectives

Further scientific knowledge in the field of astronomy and astrophysics by complementing and augmenting ground and space-based observation capabilities through development and operation of a next generation airborne observatory.
Stratospheric Observatory For Infrared Astronomy

- World’s largest flying telescope
- International Cooperative Effort between NASA and DLR
  - Aircraft Ops: NASA Dryden Aircraft Ops Facility, Palmdale, CA
  - Science/Mission Operations
    - NASA Ames Research Center, Moffett Field, CA
    - Universities Space Research Association, Columbia, MD
    - Deutsches SOFIA Institut (DSI), Universität Stuttgart
- Operational lifetime planned for 20+ years
  - Designed to operate at 39,000 to 45,000 feet
  - Above > 99% of obscuring water vapor
  - 7 different scientific instruments, initially; more to follow
- World-wide deployments: 960 science hours per year
Why Stratospheric

Mauna Kea

Wavelength (μm)

Transmission

SOFIA

Wavelength (μm)

Transmission
Observatory - The Aircraft

- Boeing 747SP-21 “Clipper Lindbergh”
- Delivered to Pan Am (1977); United Airlines (1986)
- Acquired by NASA in 1997; first flight 2007
- Based at NASA Dryden Aircraft Operations Facility (Site 9), Palmdale, California
- MTOW: 696,000 lbs
- Max Alt: 45,100 ft
Observatory Layout

- Observatory Power
- Water Vapor Monitor
- Pressure Bulkhead
- Open Cavity (door not shown)
- Public Outreach Section
- Mission Director, Telescope Operators, Scientists
- Telescope
- Scientific Instrument
Observatory - The Telescope

- 2.5m optical/infrared/sub-millimeter
- Built for DLR by MT Aerospace and Kayser-Threde
  - Primary mirror: "ZeroDur" glass ceramic from SCHOTT AG
  - Cassegrain Focus in Nasmyth arrangement
  - +15 to +70 degrees above the horizon (full range)
  - Weight: 44,000 lbs/20,000 kg
When observing, GREAT will move with the telescope plus or minus 20 degrees from its normal 40-degree angle.
Infrared Astronomy

Aerodynamics

Steve Cumming
Flying with Open Cavities

• Flying a large open cavity can be problematic
  – Cavity resonance is common
  – Severe resonance can cause structural damage or fatigue
• Large aircraft cavities often resonate at higher speeds due to Rossiter modes
• The most common solutions to dealing with resonance are an aerodynamic fence, an over-designed structure or flight envelope limitations
History of Large Cavities in Flight
SOFIA Cavity Design

• SOFIA program had several requirements that made commonly used cavity treatments undesirable
  – Provide a platform for observing over a wide range of the EM spectrum
  – Maximize time at-altitude, on-condition
• Plan was to use a shaped cavity and aft ramp to appropriately control the shear layer and minimize the probability of resonance
• To maximize the probability for success a series of wind tunnel tests were undertaken to design the SOFIA cavity
  – Testing began in 1990 and was completed in 1997
  – 5 series of 7% scale wind tunnel tests were completed
SOFIA Wind Tunnel Tests

- SOFIA I
  - Investigated cavity configurations to prevent resonance
  - Established basic flow control design
  - Several 747 variants tested
  - Forward cavity
- SOFIA II
  - 747-200, 747SP variants tested
  - Aft cavity
- SOFIA III:
  - Investigated effects of different TA model designs
- SOFIA IV:
  - Investigated aero-optical properties of candidate configurations
- SOFIA V:
  - Investigated candidate door designs
  - Tested final cavity design and configuration
SOFIA Cavity Design
Pre-Flight Analysis and Test

• Substantial testing and analysis was performed prior to SOFIA flight tests

• Aerodynamic and Acoustics tests and analyses:
  – 7% wind tunnel tests
  – 3% wind tunnel tests
  – CFD
  – Baseline flights
  – 6-DOF SOFIA airplane simulation

• Due to the extensive analyses, we had a detailed set of pre-flight predictions for acoustics and possible aerodynamic effects of the cavity
Baseline Flights

Pre-Flight Predictions

- Predictions for cavity acoustics and stability and control effects were generally positive.
- Predicted cavity acoustics were predicted to be well within design range (with some exceptions).
- Predicted stability and control effects due to the cavity were relatively small.
Predicted Cavity Acoustics

Cavity Aft Bulkhead SPL vs. Mach

- 15k ft
- 25k ft
- 35k ft
- 40k ft
Pre-Flight Technical Concerns

• Despite the extensive amount of analysis and test data, there were still serious concerns prior to open door flights:
  – The shear layer control design had not been fully proven outside of wind tunnel tests
  – Scaling issues sometimes make acoustic wind tunnel tests unreliable
  – 3% wind tunnel tests indicated there was a possibility for cavity SPL above limits
  – Predictions for stability and control effects were not considered highly reliable or accurate
  – Some aerodynamic issues, such as possible pitot-static effects were unlikely to be predicted by the available analysis methods
Envelope Expansion Plan

- The set of test points selected for envelope expansion were quite substantial.
- Primary drivers for envelope expansion points were acoustics, aerodynamics and S&C.
- Large number of test points were driven by a couple key issues:
  - Analysis limitations and blind spots.
  - Design of the cavity door system meant that the entire envelope had to be cleared for every configuration.
FLIGHT TEST

Troy Asher
Test Plan

• **OBJECTIVE:** Certify the airplane as a public use aircraft
  – Based on Type Cert. A20WE Rev 41, Mil-Specs, and NASA best practices
  – Additional engineering & science mission requirements
  – Focus was on envelope expansion and certification of the airframe
    • Some effort to show compliance with mission requirements

• **PROGRAM GOAL:** Clear SOFIA for “Early Science”
  – Short Science: ≥ 35,000 ft MSL and telescope up to 40° elevation
  – Basic Science: > 41,000 ft MSL and telescope full range (58.3°)

Program at risk due to imminent funding loss
Rigid NASA and DLR HQ Milestones
Test Plan Development

• Airworthiness testing
  – Performance
  – Flying/Handling qualities
  – Model validation
  – Demonstration of satisfactory structural characteristics
  – Flutter
  – Ground Vibration Test (GVT) to validate/update FEM

• Major Test Disciplines involved
  – Aerodynamics (incl. acoustics) – Door Drive System
  – Stability & Control – Science
  – Structural Dynamics (Flutter) – Operations
  – Static Structures (Loads) – Telescope
Test Point Selection

• Concentrate on areas not modeled or wind tunnel tested
• Risk of *acoustic resonance* drove check of multiple door/aperture positions
  – 10%, 40%, 70%, 100% Open – Door could be moved in flight
  – 23°, 30°, 40°, 50°, 58° Aperture – Set prior to flight

• No data for door open landing configuration
• Include ‘Contingency’ test points to cover any unknowns
## Envelope Expansion

Challenges

- Primary mirror already installed
  - Sun cover
  - Contamination
  - Thermal conditioning
- No test software load
  - Designed to always open door to 100%
  - “Manual Control” for intermediate positions
- Separate flight for each aperture setting
- Instrumentation batteries only good for 6 hours
- “Ride-along” testing for Early Science
Reality Strikes

• “You have too many test points!”
• Defining the problem
  – Milestones: “First Light” & “Initial Science” (ISF)
  – 6 hour flights determine max test points/flight
  – Data analysis/inspections drive fly rate

Estimated test capacity: 1000 test points
The Approach

• “Schedule for Success” but plan for the worst
• Optimistic assumptions vs. flight test results
  – Assume best-case technical results from flight test
  – If test results validate models, skip ahead but spot check
    • Fly 23° aperture at all test conditions
    • Fly 40° aperture at a reduced set of test conditions
    • Go back and spot check 30° aperture
• Publish a “Success Oriented” Schedule, BUT
• If any optimistic assumptions are inaccurate, more test points will be flown to investigate...schedule will slip
• Not all optimistic assumptions expected to be accurate
Reduced Airspeed Envelope

Includes misaligned TA

M<sub>Mo</sub> 0.87 Mach

TA/AA 23° and URD 100%
DER Recommendations

• Consulted with FAA Designated Engineering Representatives on adequacy of test plan
  – 15 items suggested for deletion from test plan
  – 9 items suggested to add to test plan
  – Majority of suggestions incorporated
Open Door Envelope Expansion Approach

\[ V_{DF}/M_{DF} = \text{maximum demonstrated flight dive speed} \]
\[ V_{FC}/M_{FC} = \text{maximum airspeed for stability characteristics} \]
Test Point Sequence

• Clear Aero, Acoustics, S&C and Flutter I.T.B.s
• Performance, buffet boundary and systems
• Open Door Landing
  – Plan one open door landing in worst-case configuration
  – No wind tunnel or analytical data for ground effect case
  – KAO had an unexpected acoustic event during flight test in the landing flare
Flight Test Results

• Final results exceeded expectations
• Found NO substantial or consistent effects on stability and control
• Sound pressure levels in the cavity were below expected values
• Handling qualities not degraded
• Flies like a stock 747

The Most Common Question

• Q: What do you feel when the door opens?

• A: NOTHING!

If you didn’t know the door was open through instrumentation and systems operating, you wouldn’t even notice it.

Stellar Occultation by Pluto

• Proof of Concept: First test of a ‘time sensitive’ operation
• Observational Objectives
  – Observe Occultation Central Flash
  – Observe Pluto lightcurve at high SNR
  – Observe Pluto/Charon joint occultations
  – Observe Pluto/Star separated photometry with HIPO
• Science Objectives
  – Measure Atmospheric Asymmetry (wind distortion?)
  – Measure Atmospheric Profile (Pressure/Temp vs. Alt)
  – Measure Atmospheric Size (Rising trend reversing?)
  – Identify Pluto Ephemeris Errors (Future events and New Horizons)
• Operations Objectives
  – Safely fly a very long mission and return to Palmdale
  – WHAT ABOUT A STUCK DOOR??
Planetary Science: Occultations

SOFIA is able to:

- Go anywhere on Earth to reach the occultation shadow of an object
- Can probe the sizes, structures (rings & moons), and atmospheres of solar system bodies by measuring how they occult background stars
- This will be the primary objective for HIPO (High-speed Imaging Photometer for Occultations)
Returning to PMD with open door

True headings back to Palmdale from the URD decision point are:

a) default flight plan 23° to 26°
b) alternative flight plan 28° to 32°

⇒ No in-flight concern with catching sunlight, because TA is facing north-west
Sun elevation needs to be considered between 9:30 am and 4:15 pm.

Landing RWY 25 before 11 am is not a factor.

40° Sun Avoidance angle given before 4 p.m.
In case of a **Go-around** in PMD only a ‘figure 8’ pattern is possible to reposition to a suitable runway

- **RWY 07 go-around**
- **RWY 04 go-around**

Do not exceed a true HDG of 110° (95° mag)

Minimum true HDG of 225° (210° mag)

A/C true HDG allowed in air: 225° to 110°
Stellar Occultation by Pluto

July 23, 2011

- Dwarf planet Pluto (V~14) occulted a star (V~14.4)
- SOFIA met the shadow of Pluto in mid-Pacific
- HIPO (Lowell Obs.) and FDC (DSI) instruments observed the occultation simultaneously

Image sequence from the Fast Diagnostic Camera (FDC)

Pluto (circled) is 13 arcsec from the star 200 minutes before the occultation.

Just before occultation: Pluto and star merged, combined light!

During occultation: Pluto and star merged, only Pluto light seen

After occultation: Pluto and star merged, combined light!
Conclusions/Lessons Learned

1. “Do Your Homework”
   – An investment in baseline, wind tunnel, and ground testing as well as engineering analysis pays large dividends

2. “Schedule for Success, Plan for the Worst”
   – This is more effective if #1 above was sufficiently done
   – Use all tools available to analyze necessary testing
   – Leave plenty of “off ramps” for unknown events

3. Have a Flight Test version of your software
   – Increases test effectiveness
   – May help avoid unknown effects
Backup
Build-Up to Open Door
Envelope Expansion

V_Df/M_Df = maximum demonstrated flight dive speed
V_Fc/M_Fc = maximum airspeed for stability characteristics
There is still considerable uncertainty in the location of the occultation track. Work to improve this is in progress, but just started. The Sun was in the way of Pluto observations for the last several months and we could only start this work a couple of weeks ago.

Inside this circle Pluto is too high in the sky - above the upper elevation limit for the door.

Outside this circle Pluto is too low in the sky - below the lower elevation limit for the door.

The sun is up, or in bright twilight, in the unshaded area here.

Pluto is this big

Or it might be here

Hawaii
Kona is 2201 NM From PMD
Time - 4:31
Latest **default** version of the flightplan for 06/23/2011

⇒ In case of an open URD event: landing in HIK is approx. at sunrise
Palmdale

Assuming that CD Dampers will be removed a.s.a.p. after landing and TA will be rotated to 0°:
- Sun Avoidance Angle in elevation will be 0° + 40° = 40° (red line)

- No on ground concern with catching sunlight elevationwise between 9 am and 5 pm
- Even with TA in lowest elevation without removing CD Dampers EL=17° (yellow line) the morning hours 9-11 am are not a concern, because TA is facing west (SOFIA's true heading while parking needs to be 0° +/- 20°
There are different options to reach U as final position for engine shut down in PMD:

- straight in approach RWY 07
- straight in approach RWY 04
- **before 11 a.m. only:** left pattern to RWY 25, taxiing B, A, E

There are different options to reach DFRC as final position for engine shut down in EDW:

- straight in approach RWY 04, taxiing B or C, F, E
- **before 9 a.m. only:** left pattern to RWY 22, taxiing B or A, E, F
**Pilot’s in-flight short reference card (1)**

*True* HDGs back to Palmdale from the URD decision point are between 023° and 032°

- **No enroute concern** with catching sunlight, because TA is facing northwest

- **Whatever TA elevation, aircraft TRUE headings verboten** in air or on ground are between 110°T and 225°T (general statement valid before 18 UTC = 11 PDT)

  or in other words:

- **True headings allowed** in air or on ground are between 226° and 109° (general statement valid before 18 UTC = 11 PDT)

**SUN AVOIDANCE overrules** other Open Door Mission Rules to prevent condensation on TA optics/electronics like gradual descent or mirror warm-up holds.
Pilot’s in-flight short reference card (2)

Flight Crew should declare an In-Flight-Emergency when back in VHF Air Traffic Control range, because of limited HDG range (inability of flying all HDGs, e.g. holding patterns or 360s impossible)

PMD: (max. SOFIA tailwind component is 10 kts)

There are 3 different options to reach Taxiway U as final position for engine shut down:

- straight in approach RWY 07, taxi to taxiway U, **park aircraft with 080° true heading** (preferred – easy taxi and easiest go-around)

- straight in approach RWY 04, taxi via E to U, **park aircraft with 080° true heading** (second – easy taxi but longer go-around)

- **before 11 a.m. only:** two ~90° left turns allowed,
  1) left turn into left base to final RWY 25 (= 265° true HDG)
  2) left turn into final RWY 25, taxiiing via B, A, E to U, **park aircraft with 080° true heading**
In case of a Go-around in PMD, consider a diversion to EDW (depending on local time, RWY 22 in EDW is only an option before 10 am PDT)

**EDW:** (max. SOFIA tailwind component is 10 kts)

There are two options to reach DFRC as final position for engine shut down:

- straight in approach RWY 04, taxiing B or C, F, E to DFRC
  park aircraft with 80° true heading

- **before 10 a.m. only:** two ~90° left turns allowed,
  1) left turn into left base to final RWY 22 (= 237° true HDG)
  2) left turn into final RWY 22,
  taxiing via B or A, F, E to DFRC
  park aircraft with 80° true heading
Pilot’s in-flight short reference card (4)

In case of a **Go-around** in PMD, **consider** a diversion to EDW
(depending on local time, RWY 22 in EDW is only an option before 10 am PDT)

If go-around in PMD was RWY 04 or RWY 07:
RWY 22 in EDW is recommended due to timing issues (see map next slide)

- **before 10 a.m. only:**
  - two ~90° left turns allowed,
    1) left turn into left base to final RWY 22  (= 237° true HDG)
    2) left turn into final RWY 22,
    taxiing via B or A, F, E to DFRC
  - **park aircraft with 80° true heading**
