Part 1 - Implementation

• Capstone Design Overview at NMSU
• Hybrid Rocket Experiment Station – starting from zero
Capstone Design Overview
ME426/ME427/AE428

NMSU course extends over one or two semesters – one full academic year for MEs; one semester for AE students.
Four to six students per team depending on project scope; usually multidisciplinary.
Class has instructor of record. Each team also generally has a faculty mentor in addition to a ‘client.’
Projects are organized with local industry, service organizations, and government laboratories.
Projects sometimes supported by sponsor with funding; sometimes not.
Students meet weekly with faculty of record and with faculty mentor, as required.
Generally, problems are practical and ‘real-world.’
Projects usually culminate with a working design.
Lecture topics:

Four to five class periods reviewing the generic design process at semester onset.
Remaining class time is used for project work, meetings, and presentations.

Assessments based on:

Reports and Presentations.
Proposal; Progress (systems analysis & conceptual design); Final (final design & evaluation).
Weekly progress reports.
One or two pages on activity journal for team.
Peer, faculty, and client evaluations.
Multidisciplinary Teams

Several disciplines are often represented:
English (tech writer)
Business (accounting, project management)
Industrial, Electrical, Mechanical and Aerospace Engineering
Figure 2.2-1  A miniaturized conceptualization of the poster-size NASA project life-cycle process flow for flight and ground systems accompanying this handbook.

The Ultimate Assistive Technology Breakthrough
Prepared for: Dr. Y.H. Park, Professor ME426

Fall 2010
NMSU STRUCTURED DESIGN PROCESS

FACET 1 – RECOGNIZE AND QUANTIFY THE NEED
FACET 2 – PROBLEM DEFINITION
FACET 3 – CONCEPT DEVELOPMENT
FACET 4 – FEASIBILITY STUDY *
FACET 5 – PRELIMINARY DESIGN *
FACET 6 – ENGINEERING MODELING AND ANALYSIS
FACET 7 – DETAILED DESIGN
APPENDIX A – ANALYSIS
APPENDIX B – PROGRESS REPORTS
APPENDIX C – SCHEDULING AND MILESTONES
APPENDIX D – MISCELLANEOUS
Typical Feasibility Assessment Questions

Project: Self feeding device
Technical Question: Does the team have the skills needed to implement all aspects of the technologies for the concept?
Technical Question: Does the team have the resources for the concept?
Performance Question: Is the concept durable?
Performance Question: Can the concept achieve speed and agility?
Economic Question: Can the team members cover the cost of construction?
Schedule Question: Can the concept be built by the time of the competition?
Marketing Question: Is the concept reusable?
Feasibility Question: What is the state of the art?
Feasibility Question: Do we have time to complete the project?
 EXAMPLE STUDENT REPORT

State of the art – results of patent search

preliminary design
Capstone Design Open Discussion

Break out groups (one hour)

In groups of 3-4, consider the following issues, and be ready to summarize your comments as a group.

• Team selection.
• Source of your senior design project topics.
• Make-up of your senior design teams: Single discipline, multi-discipline, etc.
• Supervision: Who supervises (1 faculty, team of faculty, etc.), 1 or 2 semester.
• Things you’ve tried in your senior design projects that have worked well.
• Things you’ve tried in your senior design projects that have not worked well.
• Your use of peer evaluation.
• Persistent problems.

Break (15 minutes)
Group Discussion (40-50 minutes)
Part 1 - Hybrid Rocket Experiment Station Implementation
hybrid rocket test

Egg Harbor Township, New Jersey 08234
NASA Classroom Propulsion Demonstrator
Project Requirements
Phillip Hebert and Bryon Maynard
NASA Stennis Space Center

Classroom Propulsion Demonstrator (CPD)
1. CPD shall be easily portable. Able to transport from a car/truck to a classroom via one person; envision a suitcase size device.
2. CPD combustion products shall not be toxic, smelly, or produce little smoke/soot; fuel is to be extruded acrylic, "PMMA."
3. CPD shall be able to be set up in no more than 15 minutes.
4. CPD shall have the following instrumentation: thrust measurement, oxidizer flow rate, chamber pressure, gas oxygen temperature, nozzle exit temperature, battery voltage.
5. CPD shall be able to perform a preset thrust profile (oxidizer flow programmatically adjustable).
6. All CPD components shall be able to be repaired or replaced in the field.
7. All CPD instrumentation shall be able to be replaced with spare in the field.
8. All CPD instrumentation data will be displayed on a flat LCD screen.
9. CPD data from firings shall be saved and easily retrieved.
10. Activation and Control of CPD shall be automatic with provision for manual control.
11. The CPD shall have a reusable in-place ignition system.
12. CPD shall be able to fire continuously for a duration greater than 20 seconds.
13. CPD shall be able to do a minimum four test firings in one hour.
14. The CPD controls shall assess readiness for operation (e.g. electrical power; igniter continuity, oxidizer pressure, article temp for restart).
15. CPD shall be able to present a pre-recorded video data of actual rocket testing on its LCD screen.
16. CPD shall operate via graphic user interface.
17. CPD shall display propulsion graphically, showing discharge changing in respect to fuel and oxidizer changes.
18. CPD shall graphically show the relationship between all propulsion variables.
19. Both recorded data and video shall be time-stamped.
20. The post-test data shall be time-aligned to a start event.
21. CPD shall have an Emergency Shut-Off capability which will remove the oxygen supply from the device.
22. Data Display shall not interfere with data acquisition and recording operations.
23. CPD shall be capable of firing horizontally.
24. CPD design team shall provide end-to-end system uncertainty calculations in terms of percentage of full scale ranges.
Sub-teams were organized based on deliverables

1. thrust measurement
2. temperature sensing
3. plumbing: O2 flow control, pressure sensing
4. data acquisition and control
5. reusable in-place ignition system
6. documentation: assembly and operator’s manuals, safety
7. packaging for portability
1. thrust measurement
   two alternative designs
   are described

   • Linear bearing slide w/load cell
   • ‘Four bar’
thrust measurement

linear bearing slide

**Total** $3,654.61
4. data acquisition & control

- System involves five analog signals:
  a. thrust – input
  b. pressure – input
  c. O2 flow rate – input
  d. O2 flow control – output
  e. temperature measurement - input
- Flexible data rates – 10 ~ 2000Hz
- LabVIEW (National Instruments)

The first decision is how much $ can be spent
data acquisition & control

upscale option: National Instruments Compact DAQ (16 bit, usb)

http://www.ni.com/compactdaq/whatis/

NI9178 chassis+required modules:
- bridge input
- analog input
- analog output
- temperature input

total roughly $5k ~ 6k
data acquisition & control

downsampling option: Multifunction NI6009 (14 bit, USB)

But NI6009 does not accommodate thermocouples or bridge circuits.
total roughly $300

data acquisition & control

LabVIEW data acquisition & O2 flow control – front panel
tnd the device number in Measurement and Automation Explorer under "My System -> Devices and Interfaces."

Set the source of events to the same device number as the 9000 plus 9FRB (e.g., Dev0/0). Set the counter to the correct device number (e.g., USB.MD16.0). Set the physical channels to the correct device number. You can find the device number in Measurement and Automation Explorer under "My System -> Devices and Interfaces."

Load the VI and make sure that "Export Waveforms To Spreadsheet File, special.t" is in the same folder as this program. Use Measurement and Automation Explorer to install and test the USB-9009 Multifunction DAQ. While in Measurement and Automation Explorer, configure a simulated device (DAQ-9878) to act as a counter.

1. Set the device number to the correct device number (e.g., Dev0/0). Set the counter to the correct device number (e.g., USB.MD16.0).
2. Set the physical channels to the correct device number. You can find the device number in Measurement and Automation Explorer under "My System -> Devices and Interfaces."

3. Set the oxygen flow output channel to the correct device number.
   a. To do this, right-click on the DAQ Assistant and click on properties.
   b. Under the "Channel Settings" box in the "Configuration" tab, click on "Details" (two right-facing arrows). Right-click on the highlighted "VoltageOut" task and click on "Change Physical Channel."
   c. Select the Dev0/0 channel and press OK.

4. Set the source of events to the same device number as the 9000 plus 9FRB (e.g., Dev0/0). Set the counter to the correct device number (e.g., USB.MD16.0).

5. Set the oxygen flow output channel to the correct device number.
   a. To do this, right-click on the DAQ Assistant and click on properties.
   b. Under the "Channel Settings" box in the "Configuration" tab, click on "Details" (two right-facing arrows). Right-click on the highlighted "VoltageOut" task and click on "Change Physical Channel."
   c. Select the Dev0/0 channel and press OK.

6. Set the file path to the local desktop (or wherever else you'd like to write the data file) by right-clicking on the file path and clicking "Browse for Path..." Set the file path to the local desktop (or wherever else you'd like to write the data file) by right-clicking on the file path and clicking "Browse for Path..."

- test procedure
- safety checklist
7. packaging

rocket to go
Test Stand Demonstration

Jake Valencia
typical data

Thrust (N)

Chamber Pressure (kPa)

Flow Rate (std. liters per minute)
lessons learned

what works

• capstone design
• a compelling topic (rocket propulsion)
• multidisciplinary teams
• weekly mentor meeting with teams and individuals
• lead engineer assignment proved valuable
• two semesters or one - flexibility has value, depending on project scope
• hybrid rocket motors - they are inexpensive, relatively easy to build and safe
lessons learned
what didn’t work; possible improvements

- more effort needed in working with students to select a project that requires integration of design effort in the end part of the process, e.g., marketing
- better instructions needed in how to keep student activity journals, along with good examples
- provide a convenient mechanism so that NASA experts can help evaluate students’ presentations and papers
- students seemed quite unaware of the space program and its significance
Part 2 – continued use

- nozzle design & testing
- fuel grain design
- efficient data analysis
- thrust stand re-design
- daq and control re-design
- increase portability
- temperature measurement
- remote operation (off the grid)
- many others
preliminary analysis

- **thrust (N)**
  - Graph showing thrust over time.

- **chamber pressure (MPa)**
  - Graph showing chamber pressure over time.

- **volume flow rate O₂**
  - (standard liters per minute)
  - Graph showing volume flow rate over time.

Key values:

- **9.22** = total impulse (N-s) - platform load sensor
- **30.00** = duration of test (s)
- **0.31** = avg thrust - platform load sensor (N)
- **26.14** = total standard liters of oxygen (l)
- **1.17** = moles of oxygen
- **37.35** = mass of oxygen used (g)
- **10.71** = mass of acrylic burned (g)
- **0.25** = mass of teflon burned (g) - estimated
- **0.0483** = total mass ejected (kg)
- **0.00161** = average mass ejection rate (kg/s)
- **19.4** = equivalent velocity (m/s) = total impulse/mass burned
- **191** = specific impulse (s)

Note: The values are indicative and may need further verification.

Theoretical Model: This is Rocket Science

Liquid oxidizer

**Fuel Regression Rate**

\[ r_f(t) = a \left( \frac{m_o}{A_p(t)} \right)^n \]

**Fuel Mass Flow Rate**

\[ \dot{m}_f(t) = \rho_f A_b(t) a \left( \frac{m_o}{A_p(t)} \right)^n \]

**Chamber Pressure**

\[ P_c(t) = \frac{C^*}{A_t} \left\{ \dot{m}_o + \rho_f A_b(t) a \left( \frac{m_o}{A_p(t)} \right)^n \right\} \]

**Thrust Coefficient**

\[ C_F = \sqrt{\frac{2\gamma}{(\gamma+1)x(\gamma-1)}} \left[ \frac{2\gamma}{\gamma-1} \left( 1 - \frac{P_e}{P_c} \right)^{\frac{\gamma-1}{\gamma}} + \left( \frac{P_e}{P_c} \frac{P_{\infty}}{P_c} \right) \frac{A_e}{A_t} \right] \]

**Thrust**

\[ F = \dot{m} C^* C_F \]

**Specific Impulse**

\[ I_{SP} = \frac{\int F dt}{g_o \int \dot{m} dt} = C^* C_F \]

Hybrid Rocket Motor Desktop System

“Bringing Science, Technology, Engineering & Mathematics into the classroom on a rocket engine”

Features:
- Actual firing of small rocket engine catches the attention and imagination of students, with digital readout and lighted display
- Users' Manual outlines exploration of STEM principles and experiments with the System, for example:
  - Uses a variety of fuels to demonstrate Science of chemistry and physics
  - Demonstrates the principles of hybrid rocket propulsion Technology from a classroom desktop
  - Comes with re-usable combustion chamber, to allow Engineering of additional fuels (according to directions)
  - Motor pressures recorded, to demonstrate how Mathematics can be used to calculate thrust levels
- Motor can be manually throttled or run a pre-programmed thrust profile, with throttle levels recorded for post-firing analysis
- High quality construction, parts and materials to maintain durable operations and appearance
- Potential for nozzle, injector and oxidizer to be changed, to use the instrument as a propulsion research tool
- Oxidizer refill kit is available for purchase, to demonstrate realistic pre-launch procedures

Designed for Safety:
- Users' Manual outlines step-by-step safe operational procedures
- Automatic shut-off if safe operating pressures or temperatures exceeded
- Level and stationary condition required for operation
- Safety Screen must be in position for operation
- All pressure containment built to high factors of safety
- Separation of fuel and oxidizer minimizes safety concerns

Space Education Group stands behind its work:
- Manual fully describes safe and educational operation of the instrument
- Technical assistance is available via email or telephone
- On-site training and demonstration is available
- Comes with 10 fuel grains (4 types), and all components for operations**
- Warranted for one year or 10 rocket firings
- Additional and replacement fuel grains and other parts are available online

"The use of any flammable material, even a bunsen burner in a classroom comes with natural risks and dangers. Safety procedures outlined in the users' manual should be followed at all times.

** The supplied Oxygen bottle comes empty for legal shipment, and must be filled onsite or by an authorized gas dealer, such as those listed in the Manual."
Rudimentary Cleaning Procedure

Using this procedure, components can be cleaned to a visibly clean level. Cleaning can occur in a shop or a cruder environment if necessary. Obviously, the cleaner and more controlled the environment is, the better.

Several instructions or options are recommended during each step. Again, the more of these instructions and options that can be included in the cleaning process, the better.

Equipment:

Water:
- Hot DI water, with a high pressure wand or nozzle.
- If DI water is not available, use the cleanest available water supply.

Note: In all cases, warmer and cleaner water is better. If gloves can be worn to enable the water temperature to be higher, that is a favorable practice. Warm or hot water cuts grease and dissolves oil deposits far better than cool or cold water.

Pans:
- Metal pans to contain cleaning solutions and rinse water. If metal pans are not available, plastic pans may be used.

Brushes:
- Clean brushes in a variety of sizes and shapes to fit small crevices and reach all ends (e.g. spiral brush, end brush, bottle brushes, tooth-brush style brush), nonmetallic scouring pads.

Warning: Ensure that the brushes will not damage the hardware to be cleaned.

Warning: Do not use metallic scouring pads because they shed particles that can either rust or become imbedded in softer materials, or both.

Note: Brush or tool extensions can be fabricated, if necessary, to enable physical scrubbing of parts that are otherwise inaccessible.

Soap:
- Soap with no moisturizers or scents added (e.g. Simple Green). If unavailable, use dish soap.

Gloves:
- Nylon gloves that tend not to shed particulate. If non-shedding gloves are not available, use rubber gloves.

Rags:
- Lint free cloth or paper wipes (e.g. Kimwipes), cotton cloth
Inspection Tools:
Magnifying glass, flashlight, otoscope (can be used for looking inside vessels and components), fluorescent lamp with magnifying glass, bright light source

Work surface and washing station:
Work surface and washing station that are located near one another
Metal surface that can be wiped clean or visually clean plastic or paper sheet to cover work surface

Note: The work surface will be used to locate items that must be kept clean during the process such as clean brushes, wipes, bags, and gloves as well as provide a location that clean items can be located while preparing for bagging after the cleaning process is complete. Finally, the work surface will be used for disassembly and re-assembly of components.

The general procedure is as follows:
1. Prepare workplace
2. Disassemble
3. Pre-clean
4. Wash
5. Rinse
6. Inspect
7. Dry
8. Re-assemble
9. Package
10. Label

Prepare Workplace
Chose a work area that is somewhat controlled to avoid open access and to minimize contamination. Get all supplies and tools together before beginning the cleaning process to avoid delays once the cleaning process is underway.

Wipe down the metal work surface or place a clean plastic sheet or clean paper on the work surface.
- Ensure that the work surface remains visually clean during the disassembly and cleaning process.
- If necessary, wipe down the work surface to ensure that contamination from one item does not get transferred to other items.

Set up a series of wash/rinse pans
- Wash pans should progress from less to more clean.
- For example, the first pan might contain hot, soapy water for pre-cleaning and soaking dirtier items. The second pan might contain hot, soapy water for scrubbing cleaner items. The third pan might be for initial rinsing, and the fourth pan might contain clean, hot water for final rinsing.
- Change out the water in each pan as required when it becomes dirty.
Disassemble
Completely disassemble the component so that all crevices and internal surfaces are as accessible as possible.

Note: Each part must be cleaned separately, in a disassembled configuration. If they are not, the effectiveness of the cleaning procedure will be significantly reduced. Parts that are not removed provide crevices and cracks that will retain contaminants and it will not be possible to clean the adjoining surfaces of the parts.

Pre-clean
Remove excessive contamination.
- Wipe the component.
- Discarding the soiled wipes.
- Continue this process until as much visible contamination is removed as possible.

Wash
Soak item in hot (the hotter, the better), soapy water as needed to loosen contaminant from surfaces.
- If item is a tank or a bottle, fill it with soapy water until it is overflowing, then let it soak.

Scrub/agitate the part thoroughly.
- Use brushes, wetted Kim Wipes, or cotton cloth.
- Pay special attention to threads, crevices, and hidden surfaces that, because of their configuration, can trap contaminants.
- If internal surfaces cannot be scrubbed mechanically then spray the inaccessible areas. If scrubbing or spraying are not possible, fill the item with hot, soapy water, plug the holes and shake it vigorously.

Note: Ensure that many suds are formed during the washing process, if there are few suds then add more water and soap. If suds don’t form, it indicates that the all the oil contamination is not captured by the surfactant.

- Change the wash water, add soap, and repeat the washing process twice for a total of three washes.

Note: This procedure amounts to very rigorous dish-washing with very careful attention given to detail and precision. The hotter and soaper the water the better. The repetitions ensure that the surface is thoroughly cleaned and that layered contamination is wetted, agitated, and removed.
Rinse

Rinse item thoroughly to remove soap and contaminant.

- Dunk and spray item with clean, hot water as needed to remove all visible residues.
- If item is a bottle then fill, shake, and empty the water until no suds are left and the water coming out is as clear as water going in.

Note: Nylon gloves should be rinsed often to remove contaminants and particles obtained by touching contaminated parts. If a particle can be transferred to a cleaned part by physical contact, it is very likely that it can be rinsed off. Rinse it off prior to touching the parts.

- Inspect rinse water.
  - Catch the last rinse water in clear a container.
  - Look for particles or grease in the water using a magnifying glass and by shining a bright white light through water.
  - If no particles are present or grease is observed on the surface (as a colorful sheen) and the water is as clear as it was from the source, move on to drying, if not repeat the Wash and Rinse steps.

Note: When washing carbon steel components, like the oxygen bottles, perform the final rinse with cold water and then dry immediately. The combined effects of cooling the carbon steel surface and drying it quickly will inhibit as much as possible the formation of rust.

Dry

Blow dry.

- Use oil-free, filtered GN2 or air if available.
- If filtered gasses are not available, use filtered compressed or canned air.

Note: It is preferable to dry parts quickly, removing all water droplets, to avoid deposits of water-borne contaminants (water spots).

Air dry.

- Set aside in a clean, isolated area to air dry.

Wipe dry.

- If water droplets remain, they can be carefully removed using a clean, folded Kim Wipe.

Inspect

Inspect item to verify cleanliness.

- Visually inspect, using magnification if available, all surfaces using the most intense light available.
- Take care to inspect small crevasses, threads, and holes.
- If any discoloration, water deposits, soap residue, or particulate are observed, remove it. If necessary, repeat the Wash and Rinse steps.

Note: if there is a significant delay between the cleaning and reassembly steps, then bag the parts to avoid contamination during the delay.
Reassemble
Reassemble the component.
- Prepare a clean, dry work surface on which to reassemble the component
- Don clean, dry nylon gloves.
- Set the cleaned, dried parts in a protected location to avoid contamination prior to and during reassembly process.
- Assemble the component.
- If gloves become soiled with lubricant or any other substance, change the gloves prior to touching the clean parts.

Package
Bag the item
- It is preferable to double bag the component with an inner bag of Nylon or Teflon and an outer bag of Polyethylene
- Heat seal the bags
- If Nylon or Teflon bags are not available, seal the item in a Polyethylene bag or a Zip-Lock bag.
Hybrid Rocket Assembly Instructions - DRAFT

Required Equipment (supplied by host)

1. Gaseous oxygen tank and regulator.
2. Standard 120V ac power source and extension cord as needed.
3. Reasonably sturdy table.
4. Fire Extinguisher.

Assembly Procedure

1. Remove components from case.
   a. From the zippered compartments, remove the O2 supply plumbing, which connects the flexible line to a ¼"NPT brass cross, and to the pressure sensor. Also remove the tools.
   b. Open the case, shown above, and remove the thrust stand, nozzle, injector plate, and rocket. Remove the control/daq module last. Position the components to be assembled as seen in the figure on page 2.
2. Assemble the rocket
   a. Remove the downstream plate from the struts
   b. Insert injector plate into the upstream plate, with the countersink towards the fuel grain
   c. Insert fuel grain into the countersink of the injector plate
   d. Place the Teflon washer between the fuel grain and the nozzle
   e. Place the downstream plate over the nozzle and secure to the struts using the supplied Allen screws
3. Thread the fuse wire into the fuel port and screw the nipple into the brass cross.
4. Connect 'quick-connect' oxygen line from the flow controller to the brass cross assembly
5. Secure rocket assembly to the thrust stand by means of Allen screws (finger tight)
6. Tighten the two stainless steel swagelok joints upstream and downstream of the flow controller/sensor
7. Secure thrust stand the table by means of a C-clamp
8. Connect the wiring: strain gauge, pressure transducer, flow controller, power cable, 'dead man' switch, solenoid valve, and USB cable
9. Attach the supplied regulator to oxygen tank
10. Connect flexible oxygen line from O2 regulator to the flow controller
11. Tighten swivel joints on the upstream and downstream side of the flow controller
12. Place the fire extinguisher at a ready location.

For reference, the figure below diagrams the O2 handling system.

Prepare for firing by following the Test Procedure Document.

**Disassembly Procedure**

1. Turn off main oxygen supply
2. Vent excess oxygen using the manual vent valve
3. Allow rocket to cool
4. Wearing gloves,
   a. disconnect the quick connect line from the ignition system
   b. remove rocket assembly from the test stand
   c. remove ignition assembly from the upstream plate
5. Disassemble the rocket assembly
   a. Remove diffuser, fuel, Teflon washer, and nozzle
   b. Attach the bottom plate to the struts and top plate to be stored
6. Disconnect all wires and roll them up
7. Disconnect oxygen line upstream of the flow controller
8. Loosen the stainless steel swivel joint downstream of the flow controller for storage
9. Replace the spent ignition fuse with a new one
10. Place all components into the case. The controller/daq module goes in first. Position it with the feet toward the side (or bottom) of the case and the permanently attached cables toward the dedicated cutout.
Pre-Operation Safety Checklist

Ensure all items on this checklist are complete during or after the assembly procedure prior to operating the Portable Hybrid Rocket.

<table>
<thead>
<tr>

Hybrid Rocket Test Procedure – DRAFT revision 2

1. Five tasks are required. We have organized the test team this way:
   - Fire Watch
   - Deadman Switch Operator
   - Time Clock Operator
   - Data Recorder
   - LabVIEW Operator

2. Verify the Pre-Operation Safety Checklist is complete.

3. Conduct pre-test briefing: eye, ear protection; establish a clear area downstream of nozzle.

4. All test personnel record his/her name and on the Test Data Sheet.

5. LabVIEW Operator, first reset the O2 flow controller. Press ‘mode’ then ensure the daq system is operating. The three signals are load cell, pressure transducer, and flow rate.

6. Data Recorder, record the following on the Test Data Sheet:
   - Test number and current date and time
   - Test Location
   - Initial fuel grain weight
   - If applicable, model number of nozzle. If not, write N/A.

7. Rotate the O2 regulator control valve ccw in order to lower output pressure. Open the main O2 valve slowly. Rotate the control valve cw to approximately 40 psi.

   The test may now begin

8. Shutoff Switch Operator, pull the trigger switch to open the normally-closed O2 solenoid supply valve.

9. LabVIEW Operator, perform the following steps:
   9.1. Using the instrumentation software, set the oxygen flow controller to the desired flow rate and allow the flow to stabilize.
   9.2. Record the following on the Test Data Sheet:
      - Data acquisition rate in samples/sec
• Stabilized oxygen flow rate value

9.3. Attach power supply to ignition system.
9.4. Verify the established clear area.
9.5. Begin data acquisition and verbally countdown to rocket ignition.

10. At the end of the countdown, LabVIEW Operator, ignite the rocket while the Time Clock Operator, begins the timer.

11. If an unforeseen event occurs, the Shutoff Switch Operator shall release the shutoff switch to terminate the test.

12. Time Clock Operator, provide the Shutoff Switch Operator with a verbal countdown or visual indication when the test time has expired.

13. Shutoff Switch Operator, when given notification to end the test, perform the following steps:
   13.1. Release the shutoff switch trigger to cut off the flow of oxygen to the rocket engine.
   13.2. Fully close the main supply valve on the O2 tank.
   13.3. Briefly open the pressure release valve to vent any residual O2 trapped in the system between the O2 regulator and the solenoid valve.

14. LabVIEW Operator, end data acquisition and save the file.

15. Data Recorder, record the following on the Test Data Sheet:
   • Duration of test, in seconds
   • Filename of current data set
   • Any additional comments or observations about the test

16. Once all test operations are complete and the hardware has cooled sufficiently (to the touch – roughly 20 minutes), disassemble the rocket, instrumentation, and oxygen hoses.

17. Data Recorder, if a scale is available, record the final fuel grain weight on the Test Data Sheet. If not, segregate the fuel grain for future analysis.

18. Remove the oxygen tank regulator and screw the valve stem cap onto the oxygen tank.

19. Place all hardware carefully into the foam inserts in the carrying case as outlined in the Assembly/Disassembly Procedure document.
Desktop Hybrid

General Specifications of the System:

- Gaseous oxidizer
- Multiple fuels: Plastics, clear plastics (i.e PMMA), paraffin, wood ....
- Modular injector design
- Throttling
- Stainless steel nozzle
- Fully electronic ignition/controls
- Chamber pressure measured
- Flow rate and chamber pressure can be controlled

Other Features

- Perfect for educational purposes
- Can be fired in doors
- Suitable for simple research projects
- Comes with the user’s manual and basic hybrid rocket design manual

Hybrid Rocket Assembly Instructions - DRAFT

Required Equipment (supplied by host)

1. Gaseous oxygen tank and regulator.
2. Standard 120V ac power source and extension cord as needed.
3. Reasonably sturdy table.
4. Fire Extinguisher.

Assembly Procedure

1. Remove components from case.
   a. From the zippered compartments, remove the O2 supply plumbing, which connects the flexible line to a ¾"NPT brass cross, and to the pressure sensor. Also remove the tools.

   control/daq module
   thrust stand

   fuel grain
   nozzle
   flow control/sensor
   Injector plate
   rocket
   supply (6)

   b. Open the case, shown above, and remove the thrust stand, nozzle, injector plate, and rocket. Remove the control/daq module last. Position the components to be assembled as seen in the figure on page 2.
2. Assemble the rocket
   a. Remove the downstream plate from the struts
   b. Insert injector plate into the upstream plate, with the countersink towards the fuel grain
c. Insert fuel grain into the countersink of the injector plate
d. Place the Teflon washer between the fuel grain and the nozzle
e. Place the downstream plate over the nozzle and secure to the struts using the supplied Allen screws

3. Thread the fuse wire into the fuel port and screw the nipple into the brass cross.

4. Connect 'quick-connect' oxygen line from the flow controller to the brass cross assembly

5. Secure rocket assembly to the thrust stand by means of Allen screws (finger tight)

6. Tighten the two stainless steel swagelok joints upstream and downstream of the flow controller/sensor

7. Secure thrust stand the table by means of a C-clamp

8. Connect the wiring: strain gauge, pressure transducer, flow controller, power cable, 'dead man' switch, solenoid valve, and USB cable

9. Attach the supplied regulator to oxygen tank

10. Connect flexible oxygen line from O2 regulator to the flow controller

11. Tighten swivel joints on the upstream and downstream side of the flow controller
12. Place the fire extinguisher at a ready location
For reference, the figure below diagrams the O2 handling system.

![Diagram of O2 handling system]

Prepare for firing by following the Test Procedure Document.

**Disassembly Procedure**

1. Turn off main oxygen supply
2. Vent excess oxygen using the manual vent valve
3. Allow rocket to cool
4. Wearing gloves,
   a. disconnect the quick connect line from the ignition system
   b. remove rocket assembly from the test stand
   c. remove ignition assembly from the upstream plate
5. Disassemble the rocket assembly
   a. Remove diffuser, fuel, Teflon washer, and nozzle
   b. Attach the bottom plate to the struts and top plate to be stored
6. Disconnect all wires and roll them up
7. Disconnect oxygen line upstream of the flow controller
8. Loosen the stainless steel swivel joint downstream of the flow controller for storage
9. Replace the spent ignition fuse with a new one
10. Place all components into the case. The controller/daq module goes in first. Position it with the feet toward the side (or bottom) of the case and the permanently attached cables toward the dedicated cutout.
Pre-Operation Safety Checklist

Ensure all items on this checklist are complete during or after the assembly procedure prior to operating the Portable Hybrid Rocket.

<table>

Hybrid Rocket Test Procedure – DRAFT revision 2

1. Five tasks are required. We have organized the test team this way:
   - Fire Watch
   - Deadman Switch Operator
   - Time Clock Operator
   - Data Recorder
   - LabVIEW Operator

2. Verify the Pre-Operation Safety Checklist is complete.

3. Conduct pre-test briefing: eye, ear protection; establish a clear area downstream of nozzle.

4. All test personnel record his/her name and on the Test Data Sheet.

5. **LabVIEW Operator**, first reset the O2 flow controller. Press ‘mode’ then ensure the daq system is operating. The three signals are load cell, pressure transducer, and flow rate.

6. **Data Recorder**, record the following on the Test Data Sheet:
   - Test number and current date and time
   - Test Location
   - Initial fuel grain weight
   - If applicable, model number of nozzle. If not, write N/A.

7. Rotate the O2 regulator control valve ccw in order to lower output pressure. Open the main O2 valve slowly. Rotate the control valve cw to approximately 40 psi.

   **The test may now begin**

8. **Shutoff Switch Operator**, pull the trigger switch to open the normally-closed O2 solenoid supply valve.

9. **LabVIEW Operator**, perform the following steps:
   9.1. Using the instrumentation software, set the oxygen flow controller to the desired flow rate and allow the flow to stabilize.

   9.2. Record the following on the Test Data Sheet:
       - Data acquisition rate in samples/sec
• Stabilized oxygen flow rate value

9.3. Attach power supply to ignition system.

9.4. Verify the established clear area.

9.5. Begin data acquisition and verbally countdown to rocket ignition.

10. At the end of the countdown, LabVIEW Operator, ignite the rocket while the Time Clock Operator, begins the timer.

11. If an unforeseen event occurs, the Shutoff Switch Operator shall release the shutoff switch to terminate the test.

12. Time Clock Operator, provide the Shutoff Switch Operator with a verbal countdown or visual indication when the test time has expired.

13. Shutoff Switch Operator, when given notification to end the test, perform the following steps:

13.1. Release the shutoff switch trigger to cut off the flow of oxygen to the rocket engine.

13.2. Fully close the main supply valve on the O2 tank.

13.3. Briefly open the pressure release valve to vent any residual O2 trapped in the system between the O2 regulator and the solenoid valve.

14. LabVIEW Operator, end data acquisition and save the file.

15. Data Recorder, record the following on the Test Data Sheet:

• Duration of test, in seconds
• Filename of current data set
• Any additional comments or observations about the test

16. Once all test operations are complete and the hardware has cooled sufficiently (to the touch – roughly 20 minutes), disassemble the rocket, instrumentation, and oxygen hoses.

17. Data Recorder, if a scale is available, record the final fuel grain weight on the Test Data Sheet. If not, segregate the fuel grain for future analysis.

18. Remove the oxygen tank regulator and screw the valve stem cap onto the oxygen tank.

19. Place all hardware carefully into the foam inserts in the carrying case as outlined in the Assembly/Disassembly Procedure document.
