Air Traffic Management Research at NASA Ames

Tom Davis
Chief, Aviation Systems Division
NASA Ames Research Center

www.aviationsystems.arc.nasa.gov
NASA Aeronautics Programs

Fundamental Aeronautics Program
Conduct cutting-edge research that will produce innovative concepts, tools, and technologies to enable revolutionary changes for vehicles that fly in all speed regimes.

Integrated Systems Research Program
Conduct research at an integrated system-level on promising concepts and technologies and explore/assess/demonstrate the benefits in a relevant environment.

Aviation Safety Program
Conduct cutting-edge research that will produce innovative concepts, tools, and technologies to improve the intrinsic safety attributes of current and future aircraft.

Airspace Systems Program
Directly address the fundamental ATM research needs for NextGen by developing revolutionary concepts, capabilities, and technologies that will enable significant increases in the capacity, efficiency and flexibility of the NAS.

Aeronautics Test Program
Preserve and promote the testing capabilities of one of the United States’ largest, most versatile and comprehensive set of flight and ground-based research facilities.
Airspace Systems Research @ Ames

Air Traffic Management

Boeing 747 Simulator

Vertical Motion Simulator

Future Flight Central
What do we do?

- Our research business is air-traffic-management and flight simulation
  - We have already made your flying experience better
  - We are trying to safely and effectively automate tomorrow’s air traffic control system ("NextGen")
  - Our flight simulation capabilities and experience are unrivaled
Research Challenges for NextGen

Why is it difficult?

• System must accommodate aircraft with:
  – Widely varying performance capabilities
  – Different flight phase (descending, climbing, cruising) in the same airspace
  – Many levels of equipage

• Operators have widely varying/competitive mission objectives
  – Hub and spoke operations and point-to-point operations are different

• Transition from current state to desired end state

• Assuring a collision risk of less than 1 in ~100 million flight hours

• Impracticality of validating ~10 million lines of software code to assure safety of automated system
  – Design of fail-safe architecture

• Testing and validation to discover the “unknown unknowns”
What are the research focus areas?

- **Concepts and Technology Development**
  - Traffic Flow Management
  - Dynamic Airspace Configuration
  - Safe & Efficient (Airport) Surface Operations
  - Super Density Operations
  - Separation Assurance

- **Systems Analysis, Integration and Evaluation**
  - System Portfolio Analysis
  - Interoperability Research
  - Integration, Evaluation & Transition
What are the research focus areas?

• **Concepts and Technology Development**
  – Traffic Flow Management
  – Dynamic Airspace Configuration
  – Safe & Efficient (Airport) Surface Operations
  – Super Density Operations
  – Separation Assurance

• **Systems Analysis, Integration and Evaluation**
  – System Portfolio Analysis
  – Interoperability Research
  – Integration, Evaluation & Transition
Traffic Flow Management

Investigate modeling, simulation and optimization techniques to manage air traffic flows subject to airspace and airport capacity constraints while accommodating user preferences with increased traffic demand in the presence of uncertainty.
Spot and Runway Departure Advisor (SARDA)

**Problem** - Surface traffic suffers from excessive taxi delay and fuel spending due to lack of planning and coordination among stakeholders

**Technical Progress in FY12**
- Enhanced scheduler for optimal runway sequence, spot release, and gate push back
- Flight info and Tower controller advisories displayed on the Electronic Flight Strips (EFS)
- Added realism by using the air traffic control tower simulator

**Impact**
- The human-in-the-loop simulation showed promising results:
  - Up to 60% reduction in taxi delay
  - Up to 34% reduction in fuel consumption
  - No increase in controller workload
- Demonstrated a potential as a near-term decision support tool for ATC and airlines

**Next Steps**
- Build a partnership with airline industry and the FAA
- Develop and test the SARDA tool for field evaluation
Current Day Conflict Alert
Dead Reckoning

false alert, a.k.a. nuisance alert
Terminal Tactical Separation Assured Flight Environment

Use flight intent information to avoid false alerts
Current Day Conflict Alert
Dead Reckoning

Missed alert, not safe!
Terminal Tactical Separation Assured Flight Environment

Use flight intent information to avoid missed alerts
Efficient Descent Advisor (EDA)

Computes trajectory-based advisories for ARTCC controllers that:

• Enable continuous descents at near-idle thrust

• Conform to Traffic Management Advisor (TMA) arrival schedules for maximum throughput

• Avoid traffic and airspace conflicts along the arrival path

• Allow clearance delivery by voice or data link

• Leverage existing flight deck automation for precision guidance and control
Potential Benefits:
Noise Reduction from Tailored Arrivals
SFO
Dynamic Weather Routes

- Flight Plan Route
- Dynamic Weather Route
- Direct-To Fix
- auxiliary waypoint
- nearby named waypoint
AAL1821 MIA/LAS

6.8 min savings
Potential Flying Time Savings

Dynamic Weather Routes - PBD Waypoints - Resolve Weather - ZFW 2010/05/14 1400 - 1630 UTC

Total Flights: 43
Total Savings: 352 min
Avg Savings: 8 min/flight

System-wide Performance & Analysis: ACES Models

National Traffic Management
Fast-time nationwide gate-to-gate simulation of NAS operations
- Full flight schedule with flight plans, winds, gate-to-gate operations

Regional Traffic Management
Thousands of agents:
- National: 1
- Regional: 20
- Local: 100s
- Airports: 100s
- Aircraft: 10,000s
- Airlines: 10s

Local Approach and Departure Traffic Management

Airport and Surface Traffic Management

High Fidelity 4-DOF Trajectory Model
- Based on laws of physics
- Realistic pilot-based control laws
- Includes elliptic-Earth trajectory propagation
- Contains modeling for aircraft/pilot variability
Taking the research to the real world...
ATM Technology Demonstration 1:
Maintaining efficient operations during higher densities

Flight Deck Interval Management (FIM) for Arrival Operations

Controller Managed Spacing (CMS) in Terminal Airspace

Integrated Arrival Solution

Traffic Management Advisor with Terminal Metering (TMA-TM)
Operational Context

Increasing level of efficiency

- Terminal TBO
  Reduced excess separation CDAs during high demand

- Terminal vectoring
  Excess separation CDAs during low demand

- En Route Metering
  (~60 sec)

- Terminal Metering
  (~30 sec)

- Ground-based Spacing Aids
  (~15 sec)

- Flight Deck-based Spacing Aids
  (~5 sec)

Independent Scheduling

Integrated Scheduling and Spacing

NOTE: Nominal spacing precision is indicated in parentheses.

Increasing level of automation, accuracy, maturity...
ATD-1 Objectives

• Demonstrate increased, more consistent use of Performance-Based Navigation
  – Precision arrival procedures from cruise to touchdown
  – Optimized Profile Descents using speed control
  – Simultaneous high throughput and fuel-efficient terminal operations

• Demonstrate ADS-B In for arrival flow management
  – ADS-B In receives surveillance information for nearby aircraft

• Accelerate transfer of NASA scheduling and spacing technologies for inclusion in NextGen
  – Scheduling based upon Ames’ Traffic Management Advisor (TMA)
  – Airborne spacing application based upon Langley’s ASTAR
  – Controller tools based upon Ames’ Controller Managed Spacing (CMS)
Terminal Metering

• Precision route structure to runways
  – Mostly RNAV OPD arrivals
  – Primarily speed control past top-of-descent

• TMA scheduler
  – Models terminal merges that affect traffic flow
  – Compatible with Interval Management and RTA operations

• Controller decision support
  – Timelines to meter points
  – TMA information displayed to en route and terminal controllers
Controller-Managed Spacing

Three Successively More Advanced Toolsets

"Schedule"
Early/Late Indicator

"Slot Marker"
Early/Late Indicator + Slot Marker

"Speed Advisory"
Slot Marker + Speed Advisory
Flight Deck Interval Management

• Computes lead and ownship times of arrival at runway
• Calculates speed guidance to achieve desired spacing over remainder of route
• Commands speed, if necessary, to prevent spacing errors

Lead ETA = 14:22:15
Ownship ETA = 14:23:30

• Assigned spacing interval: 90 sec
• 15 seconds early
→ Slow down 5 knots
Summary

• Our research business is air-traffic-management and flight simulation
  – We have already made your flying experience better
  – We are trying to safely and effectively automate tomorrow’s air traffic control system
  – Our flight and air traffic simulation capabilities and experience are unrivaled
Backup Slides
We have already made your flying experience better: Nationwide Deployment

FAA Air Route Traffic Control Centers
(date of operational TMA deployment)

Multi-Center TMA Test Sites
estimated potential yearly savings*
$45.6M (in 2003 USD)

Initial TMA Deployment Sites
2000-2004 estimated $180M saved, delay reduced 72,000 hrs.

NASA Prototype
1997-2004 estimated $50M saved

*at 5 airports: PHL, LGA, EWR, JFK, TEB
(Single-Year NaCo-Wide Benefits Assessment of Multi-Center TMA, June 2004)
AAC Autoresolver

Solve aircraft-to-aircraft conflicts, arrival metering and weather avoidance in integrated fashion
Major AAC Research

- Handle trajectory prediction errors in robust and efficient fashion
- Assure seamless integration of strategic and tactical systems
- Prove feasibility of future arrival management concepts
