Aerodynamic Measurements of an Incidence Tolerant Blade in a Transonic Turbine Cascade

Ashlie B. McVetta  
NASA Glenn Research Center, Cleveland, Ohio

Paul W. Giel  
ASRC Aerospace, Cleveland, Ohio

An overview of the recent facility modifications to NASA’s Transonic Turbine Blade Cascade Facility and aerodynamic measurements on the VSPT incidence-tolerant blade are presented. This work supports the development of variable-speed power turbine (VSPT) speed-change technology for the NASA Large Civil Tilt Rotor (LCTR) vehicle. In order to maintain acceptable main rotor propulsive efficiency, the VSPT operates over a nearly 50% speed range from takeoff to altitude cruise. This results in 50° or more variations in VSPT blade incidence angles.

The Transonic Turbine Blade Cascade Facility has the ability to operate over a wide range of Reynolds numbers and Mach numbers, but had to be modified in order to accommodate the negative incidence angle variation required by the LCTR VSPT operation. Details of the modifications are described.

An incidence-tolerant blade was developed under an RTPAS study contract and tested in the cascade to look at the effects of large incidence angle and Reynolds number variations. Recent test results are presented which include midspan exit total pressure and flow angle measurements obtained at three inlet angles representing the cruise, take-off, and maximum incidence flight mission points. For each inlet angle, data were obtained at five flow conditions with exit Reynolds numbers varying from 2.12×10^6 to 2.12×10^5 and two isentropic exit Mach numbers of 0.72 and 0.35. Three-dimensional flowfield measurements were also acquired at the cruise and take-off points. The flowfield measurements were acquired using a five-hole and three-hole pneumatic probe located in a survey plane 8.6% axial chord downstream of the blade trailing edge plane and covering three blade passages. Blade and endwall static pressure distributions were also acquired for each flow condition.

Motivation for VSPT Technology

Principal Challenge
Variability in main-rotor speed:
– 650 ft/s VTOL
– 350 ft/s at Mn 0.5 cruise

Approximately 10 pts. in $\eta_{\text{prop}}$

VSPT Challenges
– Wide incidence variation
– Transitional Reynolds numbers

VSPT Approach
– Incidence tolerant blade
– Reynolds number variation
– Detailed measurements for CFD code/model validation needed.

Large Civil Tilt-Rotor

Transonic Turbine Blade Cascade

Blades:
- 11 blade passages
- span = 6.000” (fixed)
- pitch = 5.119” (fixed)
- axial chord ~5” (typical)

Inlet:
- dry, clean, ambient $T$
- (filtering: 98% of 0.35μm
  99.9% of 2 μm)
- well-documented inlet; nominal $\delta_{in} \approx 1.0$ inch
- various static and blown turbulence generating grids available.
Transonic Turbine Blade Cascade Facility

Current Facility Configuration with VSPT incidence-tolerant blade set at the baseline 40.0° inlet angle

Supply Pressure = 40 psig

Max Plenum $P = 14.7$ psia
Max Mass Flow $\sim 55 \text{ lb}_m/\text{s}$

Exhaust pressure:
- $\text{min } P \approx 2$ psia
- $\text{max } = \text{inlet } P$

Optional turbulence grid

Disk diameter 6 ft.
Original Facility at min & max incidence angles

minimum inlet flow angle = 33.8° from axial

maximum inlet flow angle = 78.6° from axial
Facility Modifications

- Extended exhaust duct
- New support bars
- Discrete upper board extensions
Facility Operating Envelope

Ma2,des = 0.72

Ma2 = 0.35
VSPT Aerodynamic Measurements

- Inlet flow angles: +40.0°, -2.5°, -11.8°.
- 5 flow conditions each.
- 5-hole and 3-hole pneumatic probes.
- Total pressure and flow angles measured 7.0% $C_x$ downstream of trailing edge.
- Blade and endwall static pressure measurements.

Blade and Survey Planes

VSPT Blades
- $C_x = 7.109''$
