Take Home Messages from Bone Summit

1. Bone is a complicated tissue.
2. NASA’s constraints – not likely to reach Level of Evidence.
3. Astronauts are understudied group.
4. Spaceflight effects on bone are unique.
5. Clinically-accepted tests have limitations (JAMA).
6. Bone medical standards (based upon terrestrial guidelines) are not applicable to long-duration astronauts and require modification.
7. NASA circumstances may require transition of research technologies to clinical decision-making.

The long-duration astronaut – not typical subject to evaluate osteoporosis (4/2013).

- Typical space mission duration – $159 \pm 32$ (range 49-215)
- Average Age – $47 \pm 5$ (range 36 – 56)
- Male to Female Ratio – 4.4 : 1
- Current total # per astronauts in corps – 59 of 365
- # repeat fliers – 6
- BMI – Male BMI $25.7 \pm 2.2$ (range 21.2 to 30.7); Female BMI $22.2 \pm 2.3$ (range 20.1 to 25.9)
- Wt and Ht- Males: Males: $81 \pm 9$ (64 to 101); $176 \pm 6$ (163 to 185)
- Females: $64 \pm 7$ (54 to 81), $169 \pm 4$ (163 to 178)
- % Body Fat: Males $20 \pm 4$ (9 to 27); Females $27 \pm 8$ (19 to 41)
- **MEDICAL PRIVACY A MAJOR CONSTRAINT**
NASA Standards for Crew Health
Based on World Health Organization (WHO)
Note: T-scores (Not BMD change).

T-score = # Standard Deviations from Normal bone mineral density [mean BMD] of young healthy persons.
WHO/ISCD* Guidelines developed for peri-, postmenopausal women and men > 50 yrs. DXA screening & surveillance unique to NASA

Overview

• NASA’s challenges to addressing skeletal risks due to spaceflight: 3 C’s

• Unique Skeletal Adaptations to Spaceflight

• Recommended Forward Actions for Risk Assessment and Management
Diagnostic guidelines using areal BMD T-scores - not appropriate or predictive for fracture in astronaut population.

BMD T-Score Values* Expeditions 1-25 (n=33)
*Comparison to Population Normals
Paradigm Shift

• “Osteoporosis is a skeletal disorder characterized by compromised bone strength predisposing to an increased risk of fracture. Bone strength reflects the integration of two main features: bone density and bone quality.” JAMA 2001
Dual-energy X-ray Absorptiometry [DXA] BMD @ Johnson Space Center

• Monitor astronaut skeletal health
• Characterize skeletal effects of long-duration spaceflight
• Evaluate efficacy of bone loss countermeasures
• Verify restored health status
What are the risks for using inappropriate DXA-BMD based guidelines?

- Unnecessarily disqualifying applicants to Astronaut candidacy.
- Not fully understanding the effects of spaceflight on hip and spine integrity.
- Inadequately evaluating efficacy of countermeasures.
DXA: BMD losses are **site-specific and rapid** vs. 0.5 – 1.0 % BMD loss/year in the aged

Serum and urinary biomarkers reflect bone turnover and mineral metabolism.

Serum:
- Total and bone-specific alkaline phosphatase (formation)
- Osteocalcin (formation)
- Total serum Calcium (40% protein bound; calcium complexes)
- Ionized serum Calcium (physiologically active)

Urine:
- Pyridinium cross-links (resorption)
- Deoxypyridinoline cross-links (resorption)
- n-telopeptide (resorption)

Hormones: (regulation of calcium homeostasis)
- Parathyroid hormone – glands - main calcium sensing organ
- 1,25 Dihydroxyvitamin D -- stimulates Ca conservation
- 25 Hydroxyvitamin D – assayed vitamin D metabolite (substrate)
Bone Turnover Markers suggest a net loss in bone mass in the skeleton.
Calcium-regulating Hormones – Endocrine system is “normal” but perturbed.

Densitometry & Reported Measurement

DXA reports areal BMD (aBMD) in g/cm² averaged for cortical + trabecular bone

QCT quantifies volumetric BMD in g/cm³ for separate cortical & trabecular bones
DXA vs. QCT Spine:
Discordant Recovery Patterns in Astronauts After Spaceflight

aBMD – areal bone mineral density $g/cm^2$

Why the clinical concern?

Femoral Neck DXA aBMD

Femoral Neck tBMD

aBMD – areal bone mineral density g/cm²

tBMD – trabecular volumetric bone mineral density g/cm³

Lower trabecular hip BMD is a predictor of hip fracture in aged men* (and in women, Bousson et al 2011)

SUMMIT RECOMMENDS AS THE CLINICAL TRIGGER FOR ASTRONAUTS.

This is the basis of Hip QCT flight study.
Overview

• NASA’s challenges to addressing skeletal risks due to spaceflight: 3 C’s

• Unique Skeletal Adaptations to Spaceflight

• Recommended Forward Actions for Risk Assessment and Management
Investigate a new medical standard for BONE Finite Element Modeling [FEM]: What is it and what can it tell NASA about hip fracture risk in the long-duration astronaut?
Finite Element Models of QCT data – “FE modeling” is a computational tool to estimate failure loads (“strength”) of complex structures.
Individual Results

Stance Loading (4 to 30% loss in strength)

Max loss 30%
Individual Results

Fall Loading (3 gain to 24% loss in strength)

Max loss 24%
Two methods of monitoring space-induced changes in bone strength do not correlate.

Stance: $R^2=0.23$
Fall: $R^2=0.05$

Which is better?
Which is better?
Fracture risk by 1 measurement or by > 1 measurement?
It’s not complicated.

Which is better?
Fracture risk by 1 measurement or by > 1 measurement?
It’s not complicated.
Summit Recommendation

EXPLORE HOW FEM PREDICTS FRACTURE IN POPULATION STUDIES
Describing changes in hip bone strength with Finite Element Modeling/Analysis: Emerging data from population studies.

FE Strength Cutoffs* Task Group

Data slide courtesy of Keyak. NOT FOR DISTRIBUTION
**RESEARCH:** Selecting FE Cutoffs for “Bone Health” - i.e., hips strong enough to account for declines due to spaceflight and to aging - to be used together with DXA BMD Standards.
Similar approach proposed for terrestrial medicine.

Improving Bone Quality Assessment Biomarkers Consortium Project

Dennis Black, Ph.D.
Gayle Lester, Ph.D.
Federal Working Group on Bone Diseases
May 1, 2013
A new surrogate/patient management

**Estimating bone strength by QCT-based finite element analysis (FEA)**

- Standard engineering approach to evaluate mechanical behavior of complex structures
  - Integrates material & structural info from 3D QCT scans
  - Can provide multiple strength metrics

- Cadaver studies show that FEA predicts bone strength better than DXA-BMD

- Has been used *in vivo* to assess effect of treatments on bone strength and to predict fracture risk in untreated subjects
Summary

- DXA – may be underestimating fracture probability and poorly estimating countermeasure efficacy for the astronaut population.

- Bone Discipline Research in progress to test QCT as a surveillance technology and to derive new cut-points for baseline bone health based upon finite element modeling.

- Bone Summit Panel is trying to formulate a therapeutic course of action, and the optimal timing of intervention.

- Leveraging Level 4 Evidence (expert opinion) from Bone Summit Panel as a means of defining and managing skeletal risks in astronauts in the absence of fracture evidence.
Thank you.

The bridge as a metaphor for bone.

I-35W Bridge Collapse in MN

• Probable cause - inadequate load capacity, due to a design error of the gusset plates (NTSB)

• “… the half-inch thick plates should have been an inch thick — double the size.”

• Contributing factors: underestimated loads to bridge, did not anticipate construction loads, did not integrate weather/salt temperature contribution to breakdown of material properties

• “Inadequate use of technologies for accurately assessing the condition of gusset plates on deck truss bridges.”

Adapted from: Pathogenesis of Osteoporosis-Related Fractures (NOF) Cooper C
Bone fragility is influenced by factors that are not detected by DXA BMD.

BMD accounts for 50-70% bone strength

- Normal bone density
- Low bone mass
- Presence of osteoporosis

Disconnects discovered in population studies.

FRACTURE CASES

NON FRACTURES
Dual Photon Absorptiometry DPA)

Adapted
1. Purpose of Hip QCT Surveillance is to implement recommendations of a clinical advisory panel of osteoporosis experts (Bone Summit 2010).

2. Collect specific QCT surveillance data to develop clinical practice guidelines to recommend to space medicine.

3. Evaluate recovery at R+1 y and, if required, R+2 y.

4. Research Study: Describe how in-flight countermeasures or how post-flight activities affect changes in bone strength and recovery.
