2nd Pacific Rim Engineering Ceramics Summit Symposium
38th International Conference and Exposition on Advanced Ceramics and Composites
January 27, 2014
Daytona Beach, Florida, USA
Outline

— Environmental barrier coating (EBC) system development: needs and challenges

— Advanced environmental barrier coating systems for SiC/SiC ceramic matrix composite (CMC) airfoils and combustors
  • NASA coating development goals
  • Current turbine and combustor EBC coating development emphases
  • Coating design issues and performance evaluation

— Development of next generation environmental barrier coatings
  • Advanced processing
  • Subelement and subcomponent demonstrations

— Summary and emerging opportunities
NASA EBC and CMC System Development

- Emphasize temperature capability, performance and long-term durability
- Develop innovative coating technologies and life prediction approaches
- 2700°F (1482°C) EBC bond coat technology for supporting next generation
- 2700-3000°F (1482-1650°C) thin turbine and CMC combustor coatings
  - Recession: <5 mg/cm² per 1000 h
- Highly loaded EBC-CMCs capable of thermal and mechanical (static/low cycle and dynamic) loading
  - (Strength requirements: 15-30 ksi, or 100-207 MPa)

**Temperature Capability**

- **(T/EBC) surface**
- **Increase in ΔT across T/EBC**
- **Ceramic Matrix Composite**
- **Single Crystal Superalloy**
- **Gen I – Current commercial**
- **Gen II – Current commercial**
- **Gen III**
- **Gen IV**
- **Year**

- **2800°F combuster TBC**
- **2500°F Turbine TBC**
- **3000°F+ (1650°C+)**
- **2700°F (1482°C)**
- **2700°F (1482°C) Gen III SiC/SiC CMC airfoils and combustor technologies**
- **2700°F SiC/SiC thin turbine EBC systems for CMC airfoils**
- **2400°F (1316°C) Gen I and Gen II SiC/SiC CMCs**
- **2000°F (1093°C)**

**Step increase in the material’s temperature capability**
Environmental Barrier Coating Development: Challenges and Limitations

— Current EBCs limited in their temperature capability, water vapor stability and long-term durability, especially for advanced high pressure, high bypass turbine engines

— Advanced EBCs also require higher strength and toughness
  • Resistance to combined high-heat-flux, engine high pressure, combustion environment, creep-fatigue loading interactions

— EBCs need improved erosion, impact and calcium-magnesium-alumino-silicate (CMAS) resistance and interface stability
  • Critical to reduce the EBC Si/SiO$_2$ reactivity and their concentration tolerance

— EBC-CMC systems need advanced processing for realizing complex coating compositions, architectures and thin turbine airfoil configurations for next generation high performance engines
  • Advanced high temperature processing of high stability nano-composites using Plasma Spray, EB-PVD and Directed Vapor EB-PVD, Plasma Spray - Physical Vapor Deposition
Environmental Barrier Coating Development: Challenges and Limitations

Various Advanced TEBC/mullite/mullite+BSAS/Si coat systems

Surface test temperature 1922°K (1649°C)

Interface reactions at 1300°C
- Fundamental studies of environmental barrier coating materials and coating systems, stability, temperature limits and failure mechanisms
- HfO$_2$ and ZrO$_2$ -RE$_2$O$_3$-SiO$_2$/RE$_2$Si$_{2-x}$O$_{7-2x}$ environmental barrier systems
  - Controlled silica content and transition element and rare earth dopants to improve EBC stability and toughness
  - Develop HfO$_2$-Si based + X (dopants) and more advanced rare earth composite compound composition systems for 2700°F+ long-term applications
  - Develop prime-reliant composite EBC-CMC interfaces for fully integrated EBC-bond coat systems
- Processing optimizations for improved coating density and composition control robustness
- Develop advanced NASA high toughness, *Alternating Composition Layered Coating* (ACLC) compositions and processing for low RE t’ low rare earth dopant low k HfO$_2$ and higher rare earth dopant silicates
  - Achieving high toughness has been one of key emphases for NASA coating technologies
  - Achieving high stability and recession resistance
  - Improve the resistance to CMAS and Volcano ash deposits
NASA Environmental Barrier Coating Technology Development – Continued

- Advanced EBC developments for various engine component applications

Advanced EBC System Strength Evaluations

- Evaluate and develop high strength and high toughness EBC materials
- Provide property database for design and modeling
Advanced EBC System Recession and Stability Evaluations

- Determining optimum compositions of in a high stability system consisting of (e.g., Yb, Gd, Y+Hf/Zr) silicates and oxide systems

Turbine airfoil EBCs: High pressure burner rig, at 10 atm, 2650°F
SiC/SiC and Environmental Barrier Coating Recession in Turbine Environments

- **Recession of Si-based Ceramics**
  (a) convective; (b) convective with film-cooling

- **Advanced rig testing and modeling**, using High Pressure Burner Rig, coupled with 3-D Computational Fluid Dynamics (CFD) analysis, to understand the recession behavior in High Pressure Burner Rig

\[
\text{Recession rate} = \text{const.} \quad V^{1/2} \quad P_{(H_2O)}^{2/(P_{\text{total}})^{1/2}}
\]

\[
\text{SiO}_2 + 2\text{H}_2\text{O}(g) = \text{Si(OH)}_4(g)
\]

(a) (b)
Recession of Film-Cooled SiC/SiC Specimens

— Potentially improve EBC-CMC stability in combustion environments

Advanced Rig Tests for SiC/SiC CMC EBC Demonstrations

- Advanced EBC coated turbine airfoils, combustor liners and subelements demonstrated in high pressure burner rig and high heat flux laser rig simulated engine environments

Vane leading edge seen from viewport in High Pressure Burner Rig Testing

NASA EBC coated turbine airfoils and combustor testing
Summary

Advanced high temperature SiC/SiC CMC environmental barrier coatings development has a key emphasis on temperature capability and durability

- Develop advanced compositions for meeting next generation engine coating and component performance requirements
- Emphasize advanced turbine CMC airfoils coatings, addressing processing, long-term stability and durability under high-heat-flux and highly loaded conditions
- Developed advanced combustor and turbine vane EBC component technologies, and demonstrating the full feature EBC - CMC sub-components in relevant rig simulated engine environments
- Developed EBC systems and subelement testing methods, helping establish property database, and developing life prediction models
- Current work also focused on thermal - mechanical stress creep-rupture – fatigue behavior of EBC-CMCs, and the stress-environment interactions on component durability
Advanced Environment Barrier Coating Material System Development - Emerging Opportunities

— **High stability, low expansion top coat development**
  - Rare earth dopants and silica clusters along with transition metal oxides for improved temperature and environmental stability
  - High melting point, reducing interface reactions – self-forming diffusion and reaction barriers
  - Controlled SiO$_2$ activity, minimizing grain boundary Si segregation, SiO$_2$ phase formation, and low melting phase formation
  - Low thermal conductivity, thin EBC configurations emphasized for both turbine CMC airfoil and advanced combustor applications

— **Low stress, strain tolerant interlayer and high strength bond coats**
  - Prime-reliant coating systems
  - High strength and advanced highly intergraded EBC/CMC interface designs
  - Self repairing and/or self-growing of slow growth adherent protective coatings, i.e., design of alloys, intermetallic and composites capable of self growing EBCs
  - Low expansion, high stability, low diffusivity, low oxygen activity, and oxidation resistance
  - High strength and high toughness to achieve maximum energy dissipation, impact and fatigue resistance

— **Multifunctional compositions for high temperature sensing, health monitoring, and reduced heat transfer**
