

# Food Security in a Changing Climate

Drs. Peter Hildebrand and Molly Brown  
NASA/Goddard Earth Sciences Division

# Food Security in a Changing Climate

Why NASA?

How is Earth's climate changing?

Why is Earth's climate changing?

How are humans affecting Earth's climate?

How is this affecting the availability of food?

What is the outlook for the future?

What about differences of opinion concerning climate ?

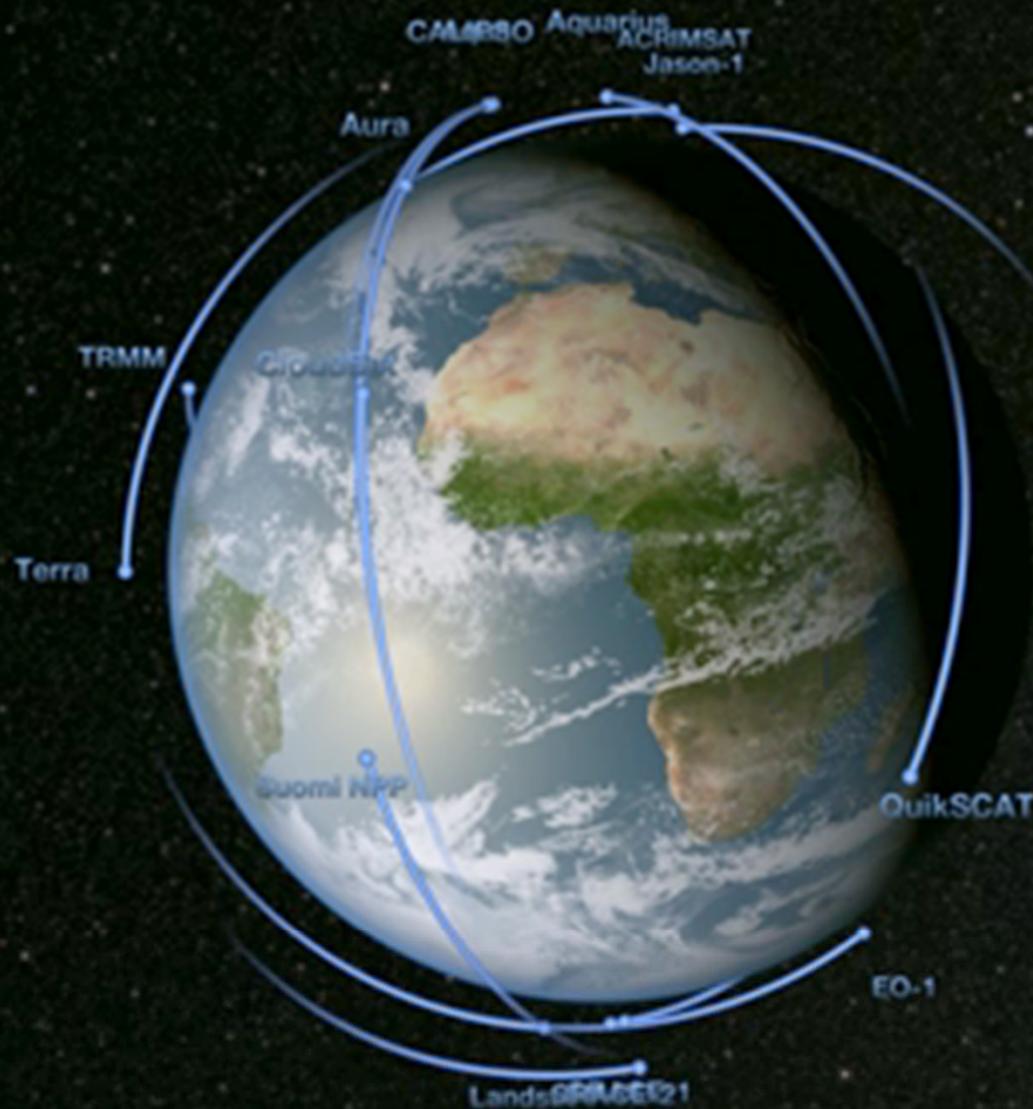

# Why NASA?

## *The Need for Satellite Observations*

- **Ground-based measurements of climate:**
  - are insufficient and declining
    - particularly outside N. America and Europe
  - lack the uniform calibration needed to assess climate variability and change
- **Satellite-based observations of Earth's global climate:**
  - provide uniform global coverage
  - can be calibrated against validating measurements
    - Ground and airborne
  - explain climate change forcing:
    - Radiation, Aerosols, Atmospheric chemistry, Global ocean circulation, Clouds explain climate change impacts:
    - Sea level rise, Ozone depletion, Sea ice depletion, Ice sheet melt, Mountain glacier melt, Air quality, Polar bear habitat, Longer growing season in high latitudes and on high mountains

# Satellite measurement of Earth properties

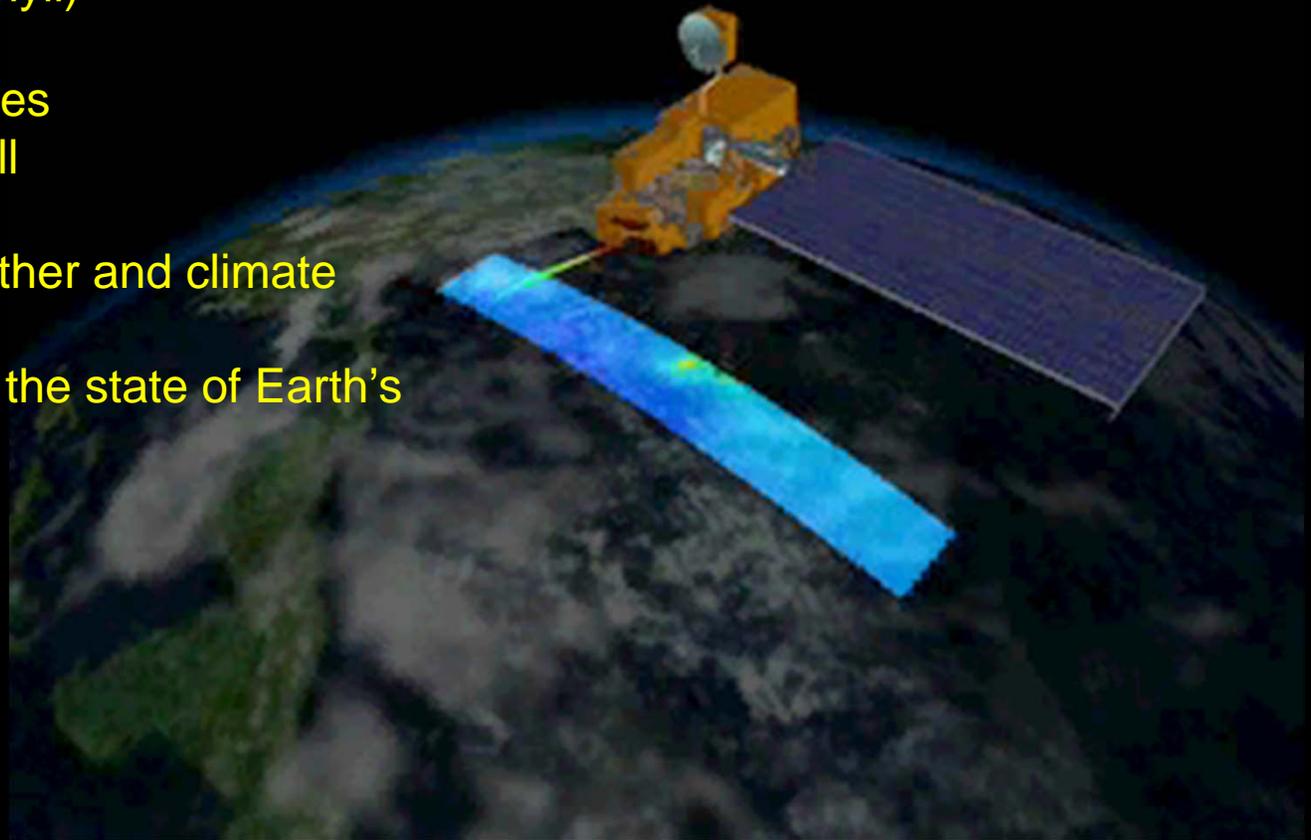

Multiple satellites measure a wide variety of earth processes:  
winds, temperatures, clouds, pollution, ocean, and land surface  
Data are used for weather and climate predictions

# Satellite measurement of Earth properties

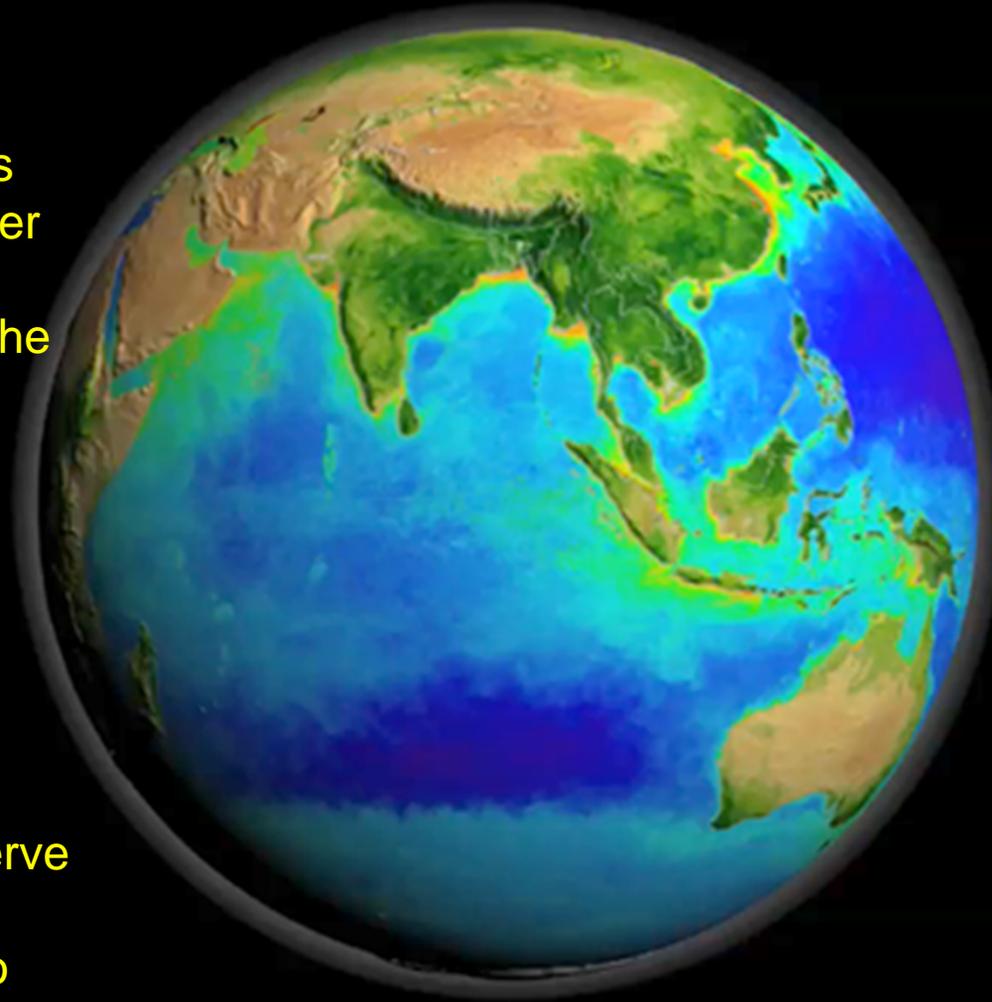

- Cross-track scanners measure:
  - Surface temperature (land and sea)
  - Atmospheric temperature and humidity
  - Plant life (chlorophyll)
  - Ocean winds
  - Atmospheric gasses
  - Clouds and rainfall
  - ... and lots more
- Data are used for weather and climate predictions
- and for understanding the state of Earth's biosphere

## Satellite measurement of Earth properties

Data from satellites are stitched together in a computer to make a picture of the whole Earth.

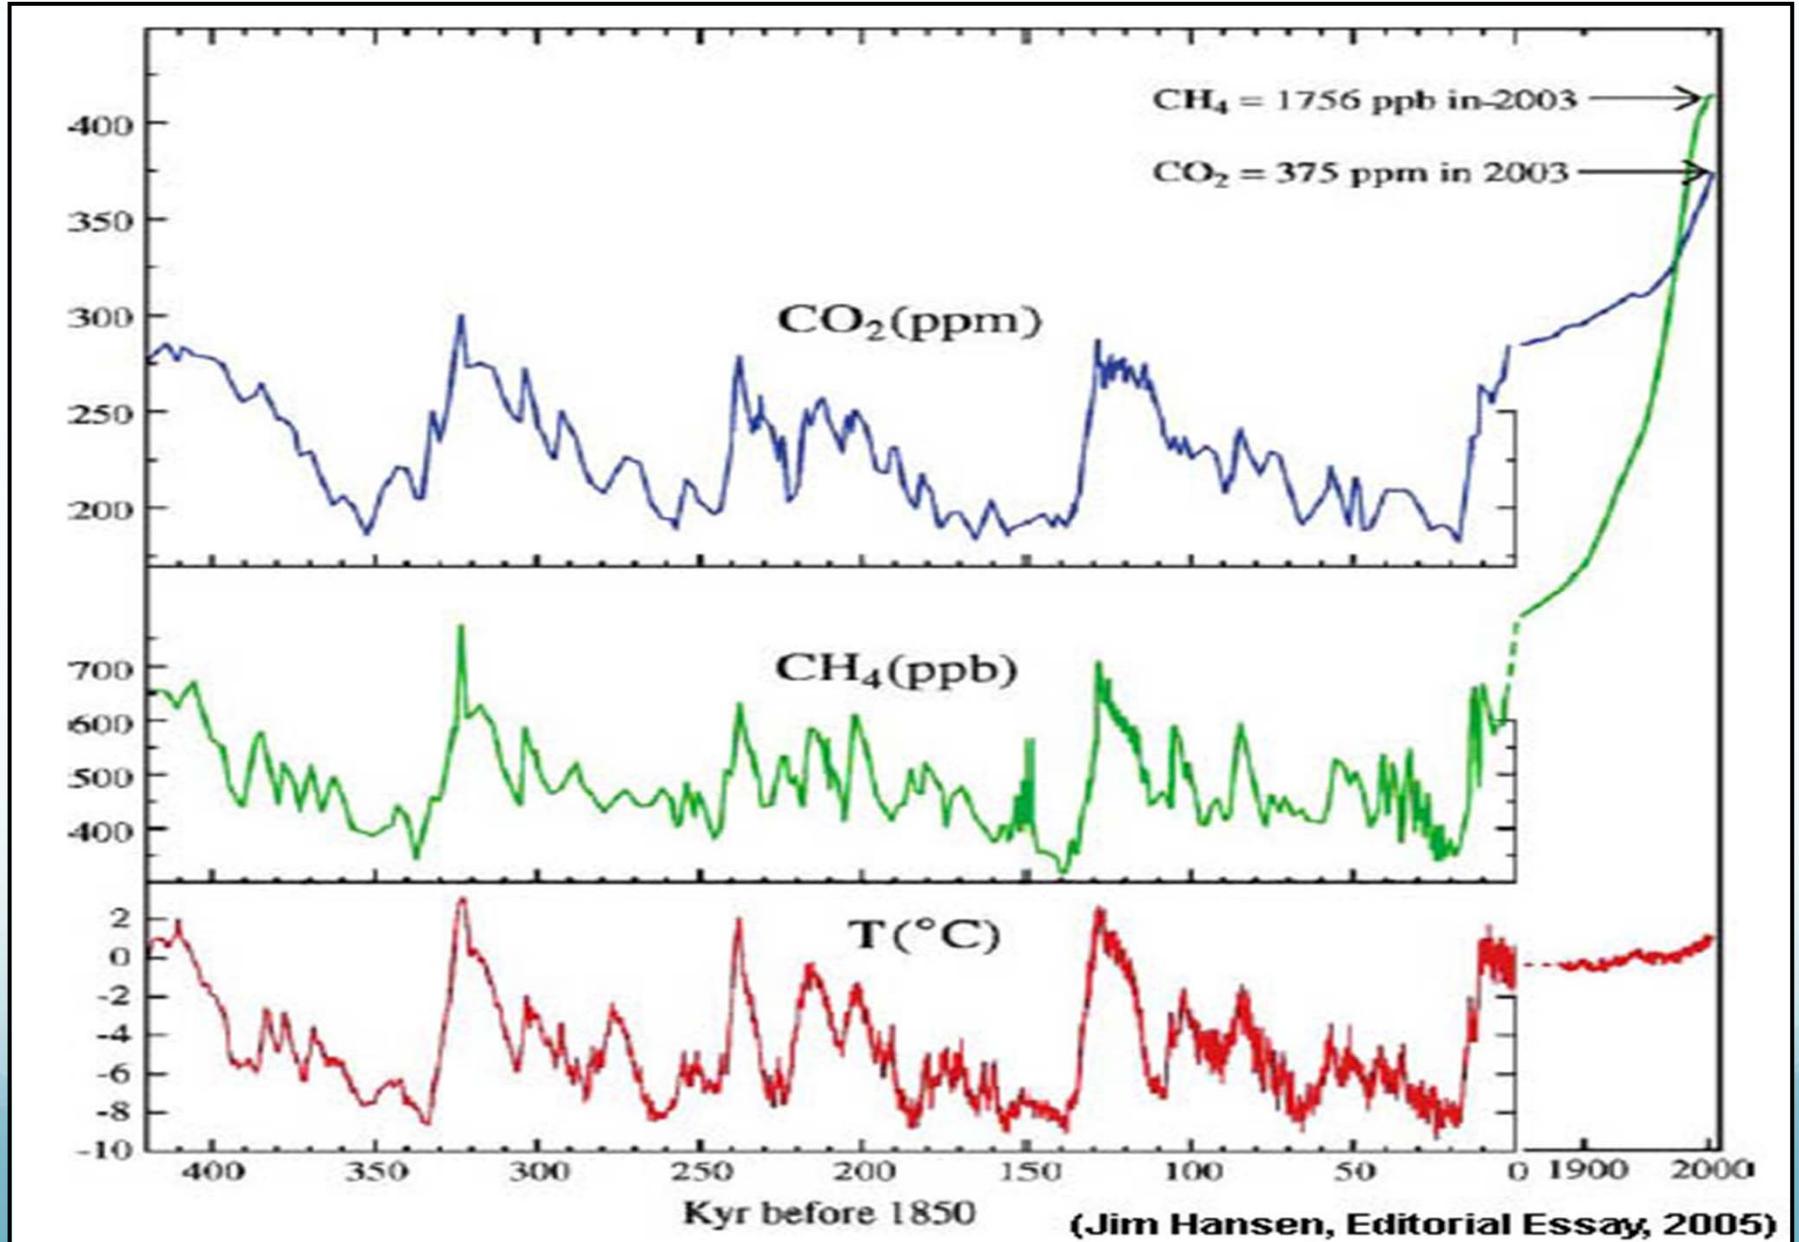

The satellites observe the full Earth more than once a day so we can measure night and day-time events.

NASA satellite data are used worldwide to better understand the Earth and how it operates.

We support the NOAA weather service and many other Agencies with our Earth observations.

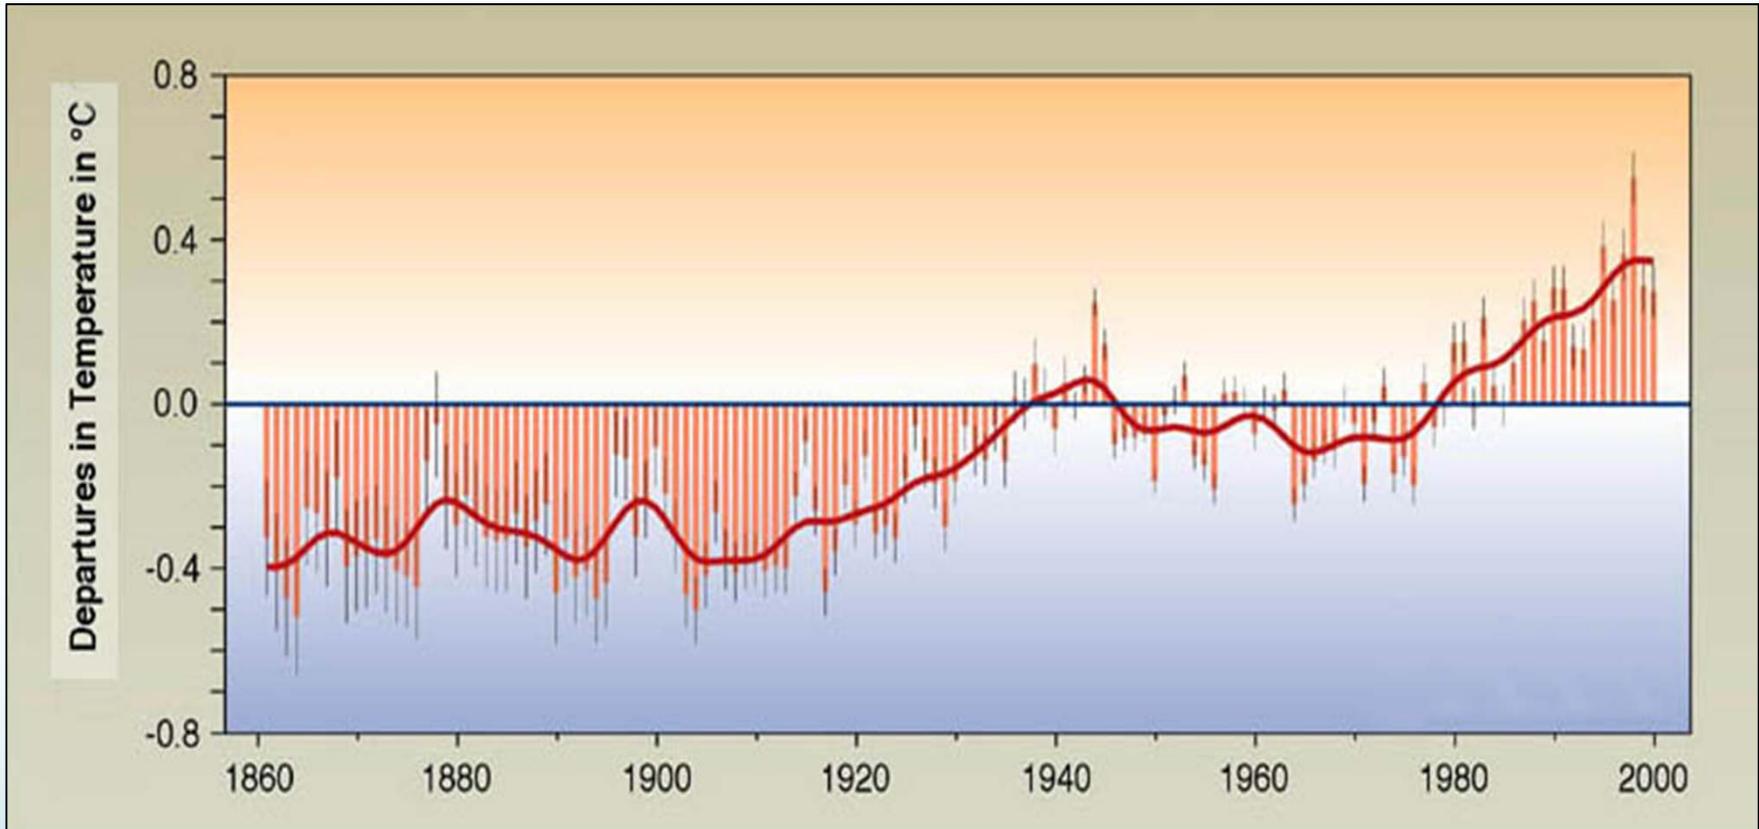

# Global Climate and Climate Change

# Global Climate and Climate Change

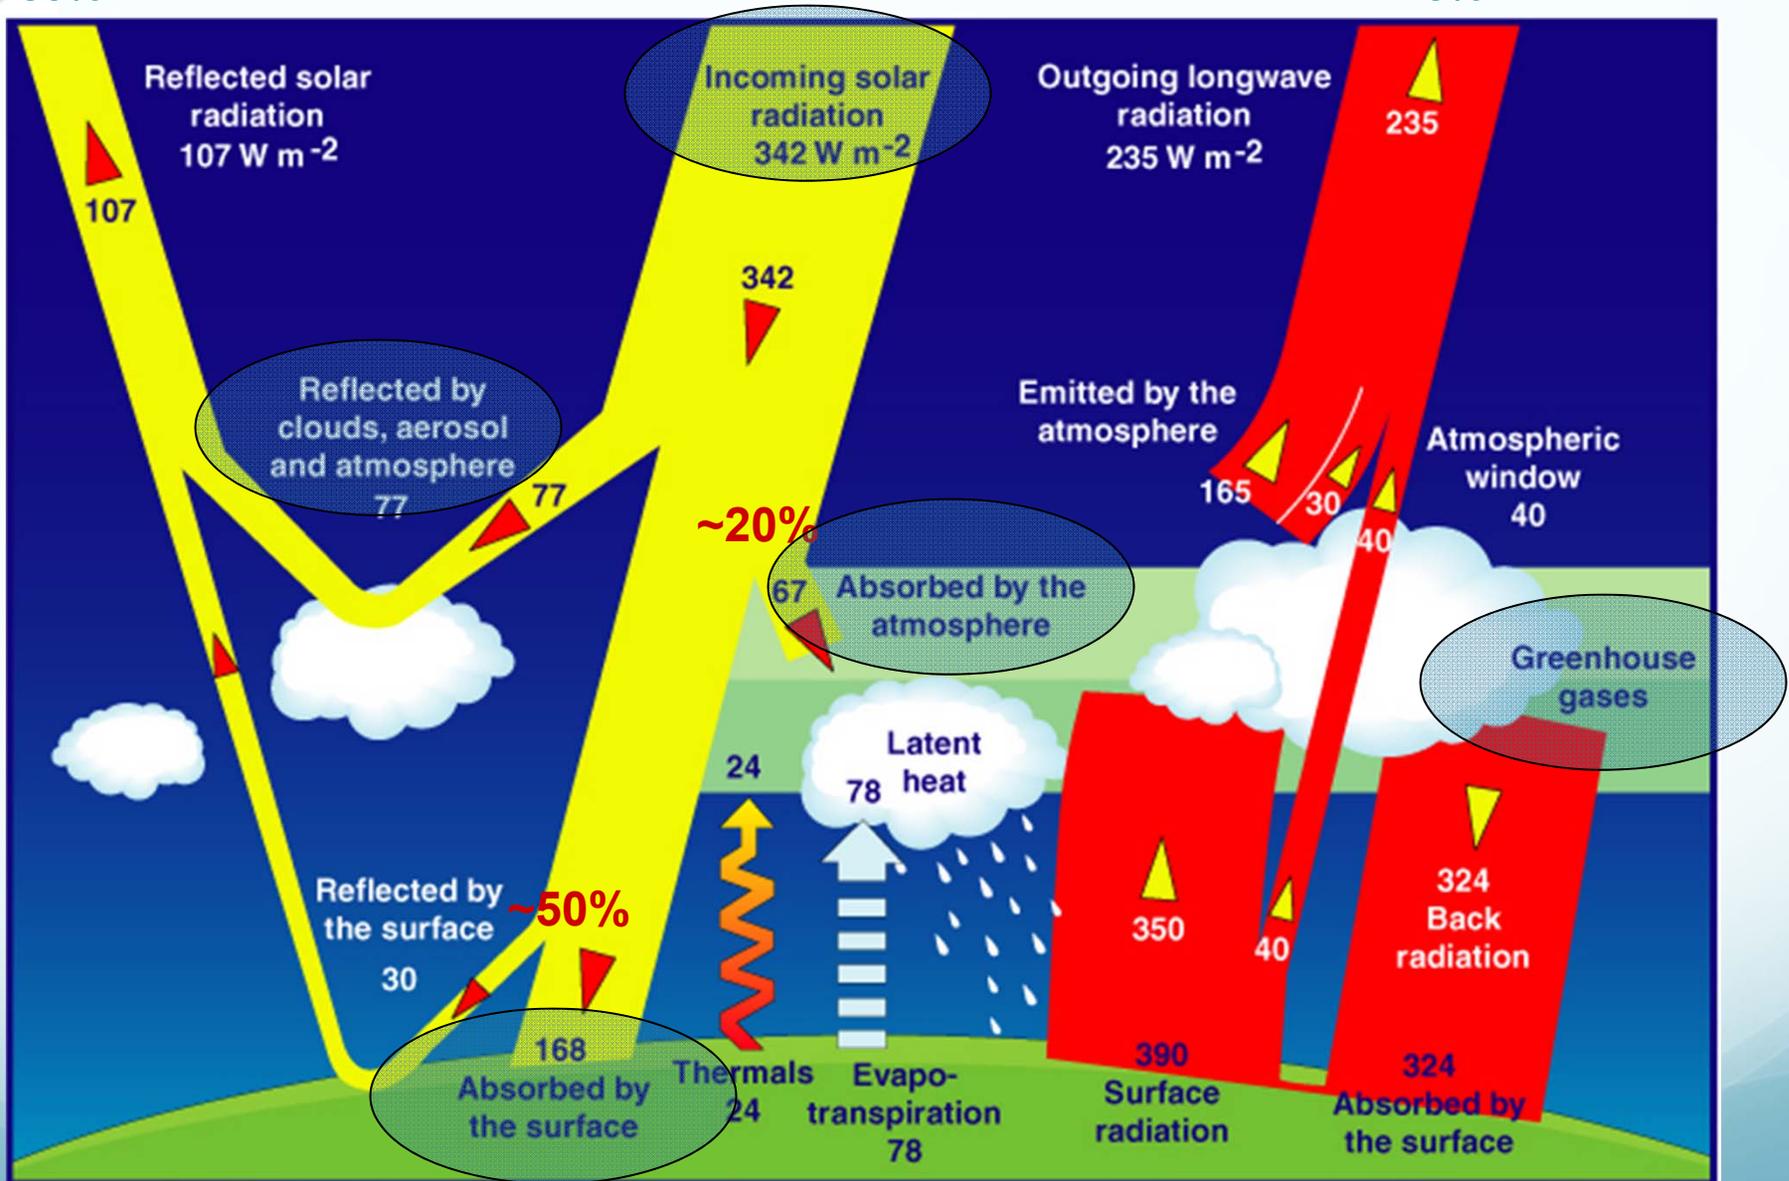

# The Earth's Radiation Budget

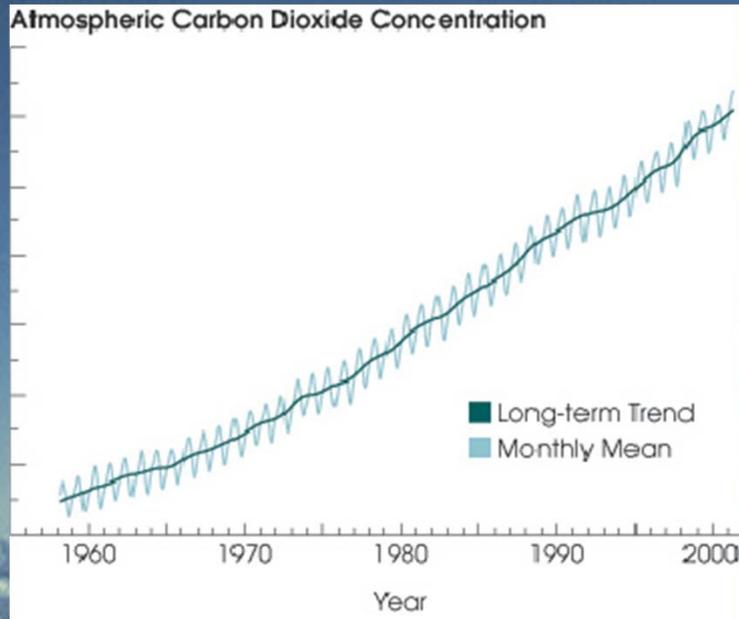

30%

~70%

(adapted from Kiehl and Trenberth, 1997, by the CERES Science Team)

# Greenhouse Gases?

- Greenhouse gas concept known since 1820s:
  - Joseph Fourier (1824, 1827)
  - John Tyndall (1861)
  - Svante Arrhenius (1896)
- David Keeling measured CO<sub>2</sub> on top of Mauna Loa
  - CO<sub>2</sub> is increasing each year

- High CO<sub>2</sub> values = northern winter
- Low CO<sub>2</sub> values = northern summer, (when trees are growing)

# Radiative Forcing of Climate Change

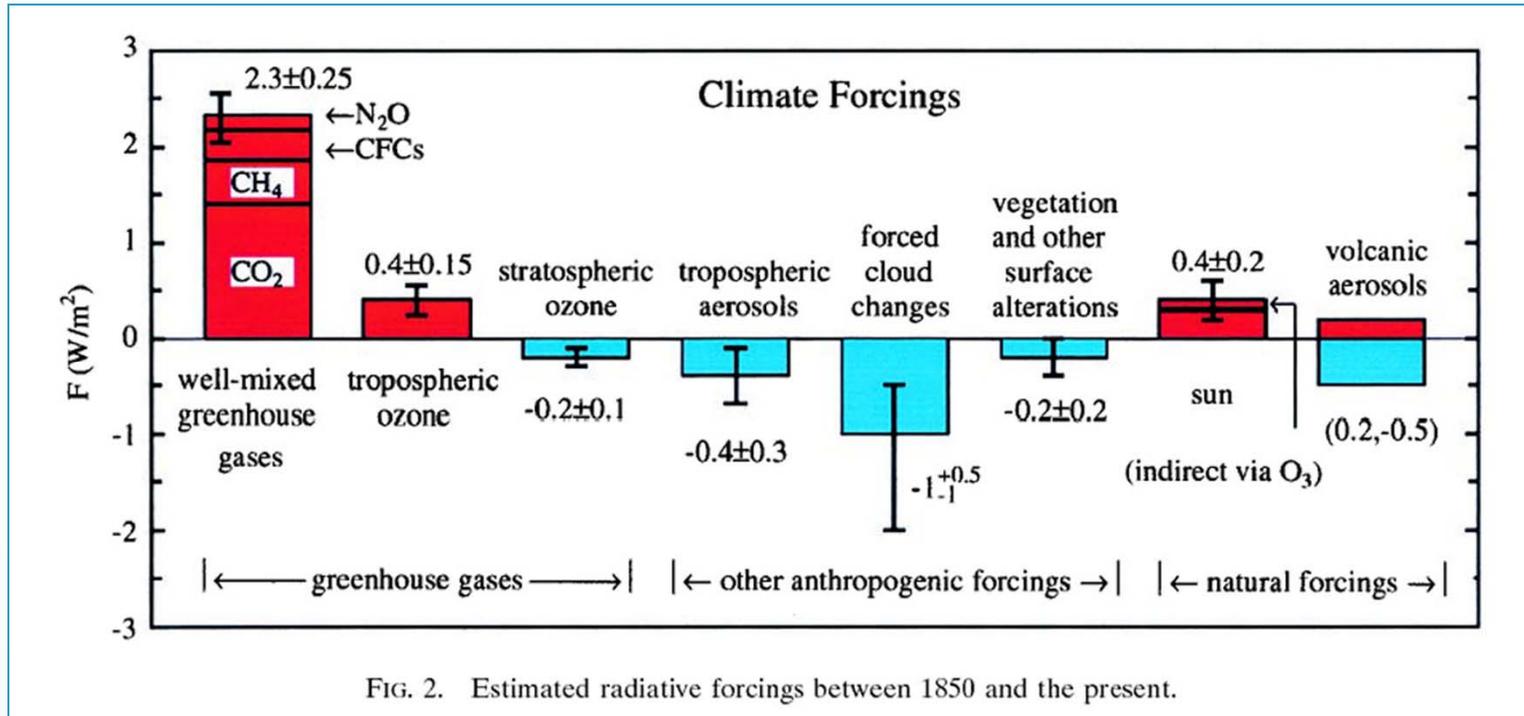

FIG. 2. Estimated radiative forcings between 1850 and the present.

## Climate Change Forcing in the Industrial Era (1850-2000)

- ▶ CO<sub>2</sub> Is Largest Forcing
- ▶ Air Pollutants (O<sub>3</sub>, CH<sub>4</sub>, BC) Cause Large Forcing
- ▶ Aerosol Effects (direct + on clouds) Most Uncertain

## Conclusion: CO<sub>2</sub> Largest Forcing, But Others Significant

# With a hotter Earth, what has happened to water resources?

- Precipitation
- Storm intensity
- Snowfall
- Runoff
- Ice sheets and glaciers
- Sea level

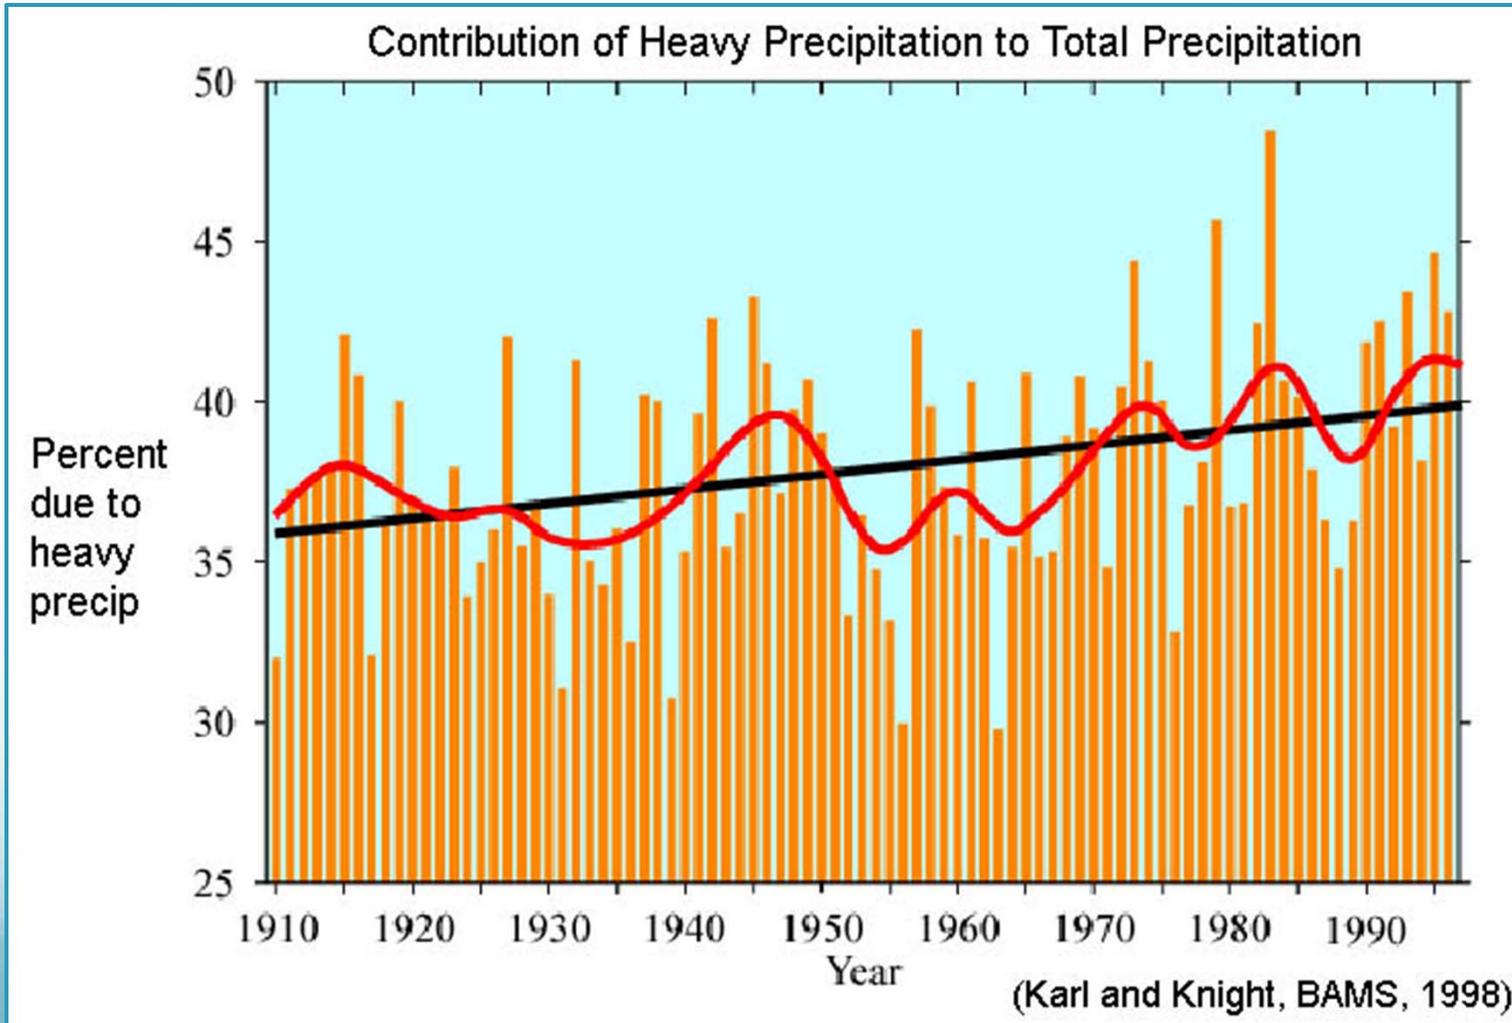

# Changes in Precipitation

## Rainfall Intensity Increases

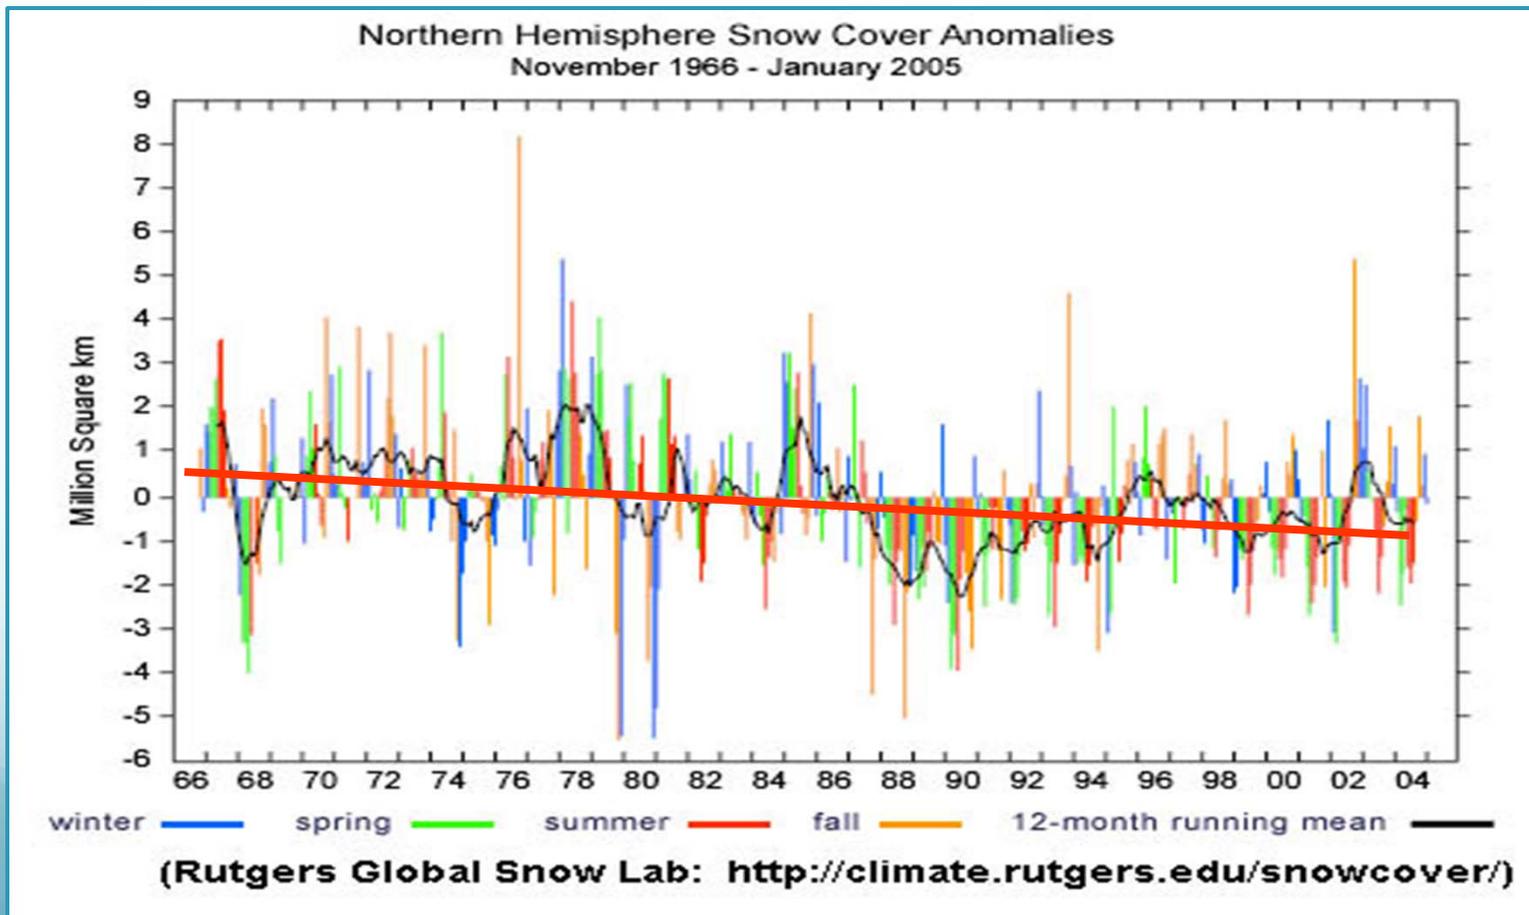

- More days with rainfall
- Heavier rainfall
- Rainfall increases due to strong events

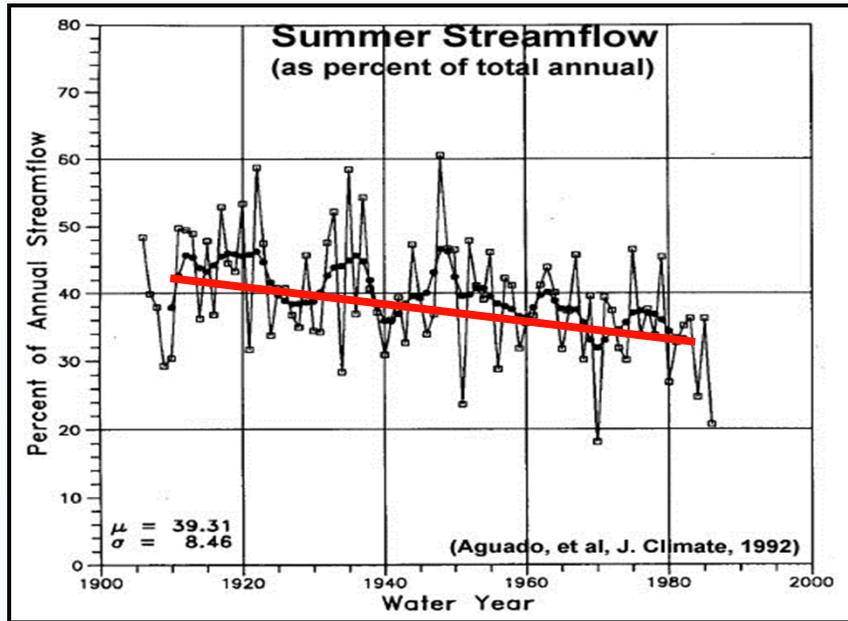

## Decreased snow cover:

- Snow starts later in season
- Snow melts earlier
- Snow cover reduced 1-2 days/yr since early 1970's
- More precipitation is rain
- Water storage in snow pack is reduced

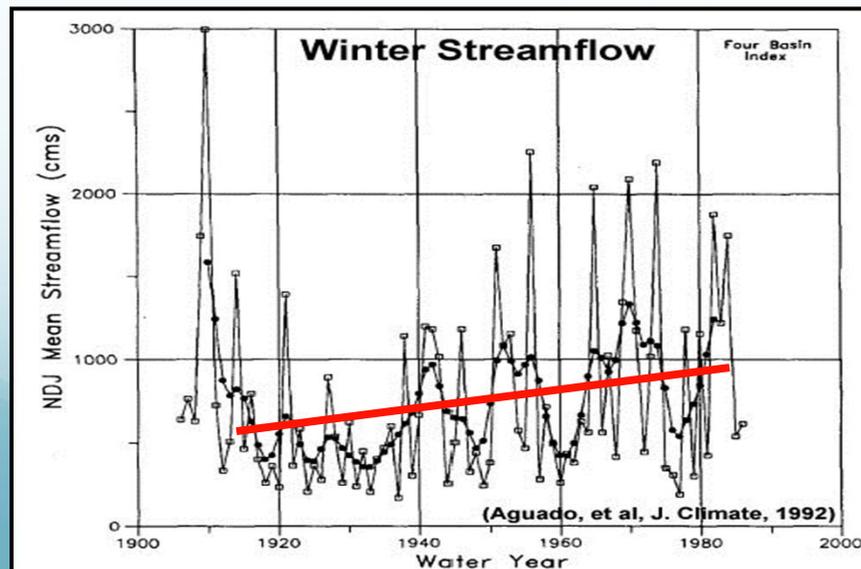

# Runoff Changes in Spring and Fall

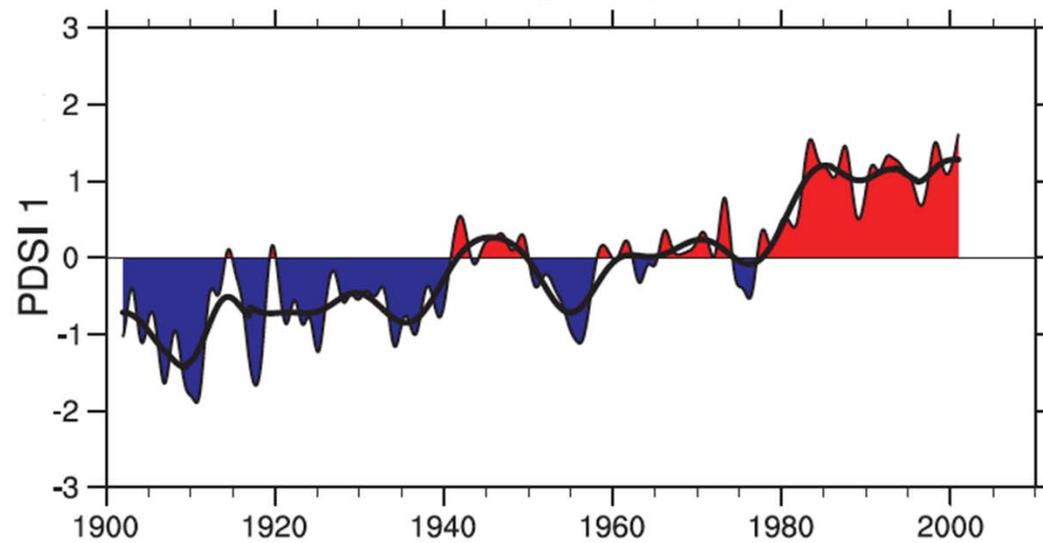

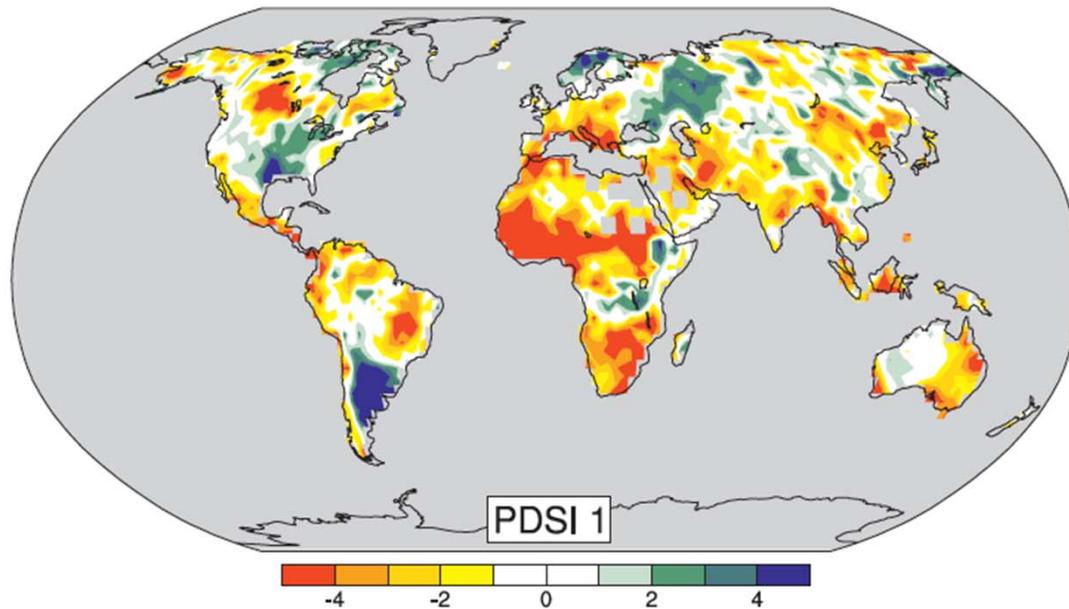

- As temperatures increase:
  - More precipitation falls as rain
  - Winter runoff is increased
  - Spring runoff pulse is earlier
  - Summer runoff is decreased

# Frequency of drought increases

# With a hotter Earth, what has happened to water resources?

- Precipitation:
  - More & Heavier events
- Storm intensity
  - Stronger large scale weather patterns:
  - More intense storms
  - More droughts
- Snowfall decrease
  - Later freeze, earlier thaw
  - More precipitation as rain
- Earlier runoff
- Melting of ice sheets and glaciers
- Sea level rise

# Humans are affecting the Earth

More and more air pollution:  
aerosols & greenhouse gasses

Apartment complex

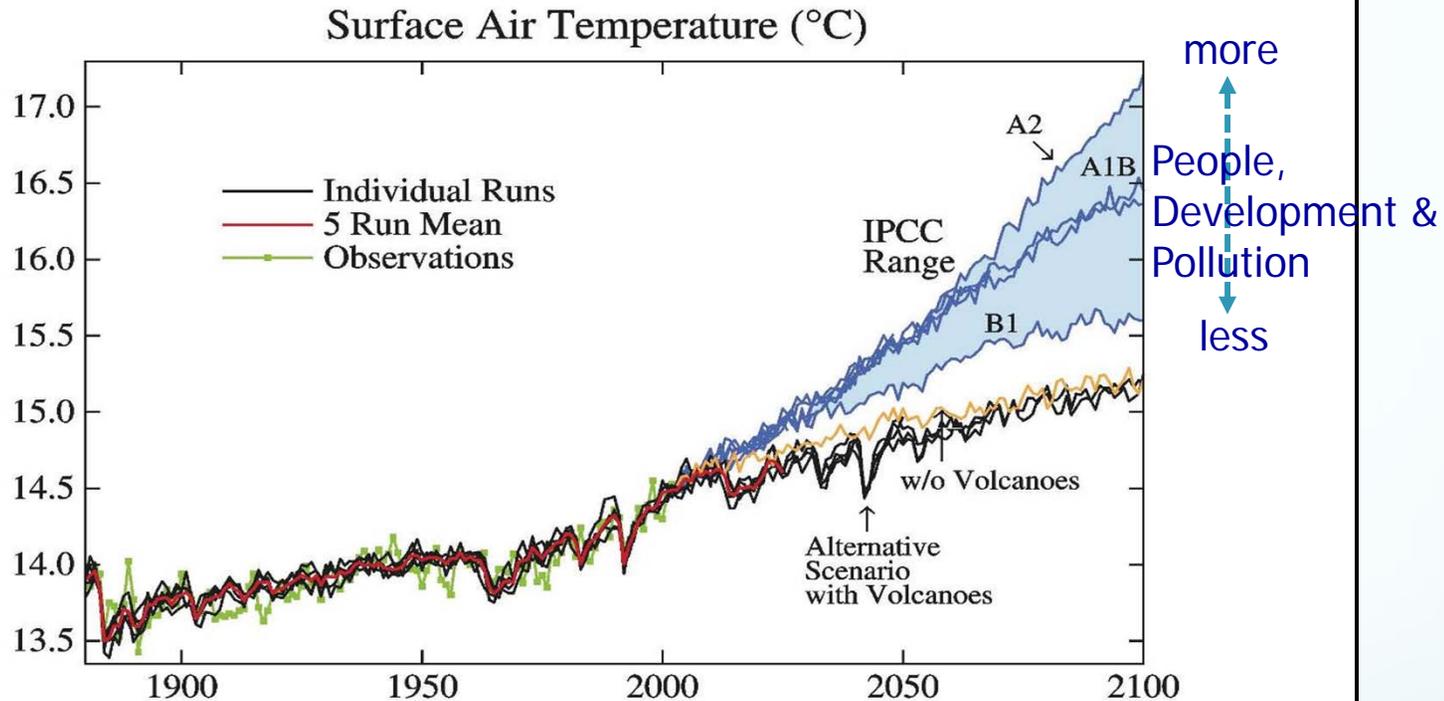

Traditional agriculture

# Climate Forecasting

## Global Climate Simulations

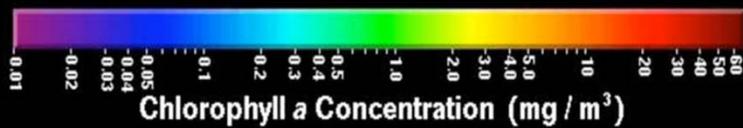

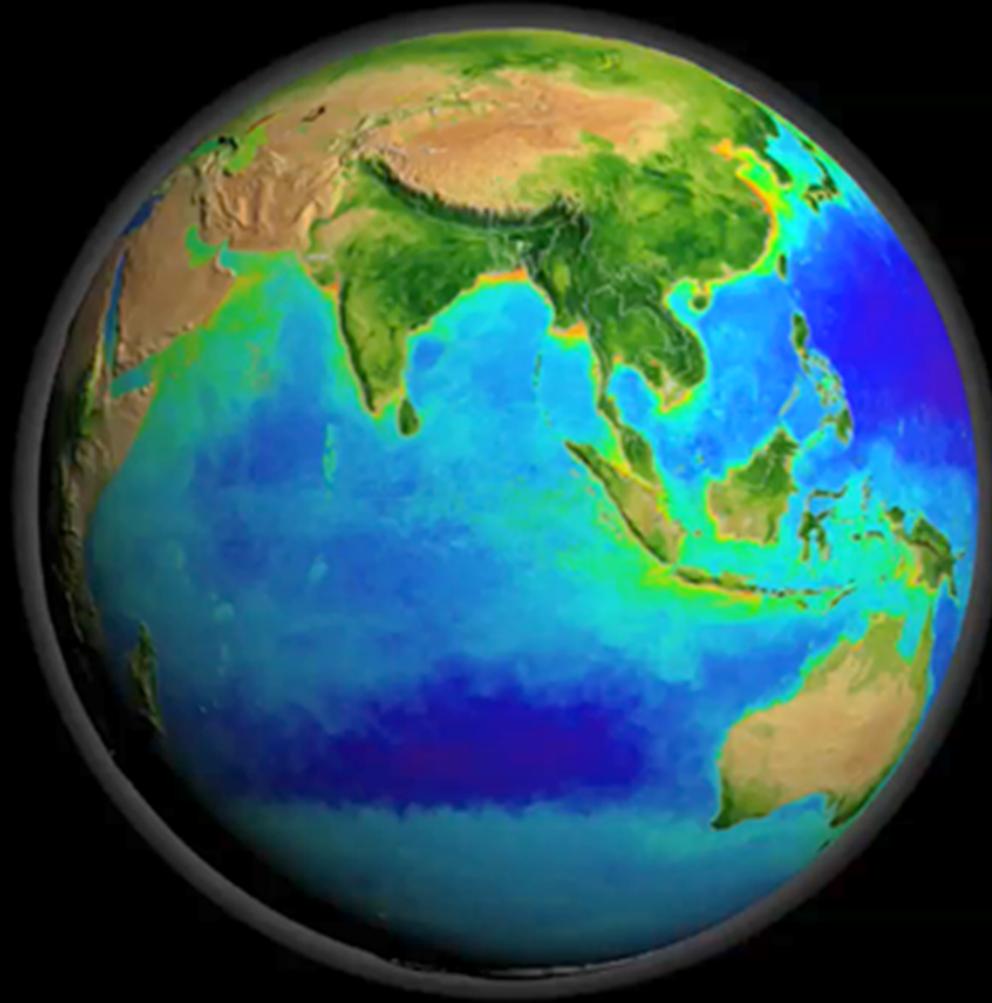

### Climate Simulations for IPCC 2007 Report

- GISS Model Fits Observations Well for 1880-2003 (but trade-off between sensitivity & forcing)
- Future Global Warming Depends Strongly on GHG Scenarios (but also depends on uncertain aerosol forcing)

## Satellite Measurement of Earth Biological Properties

# NASA Land Information System (LIS)

## LIS Development:

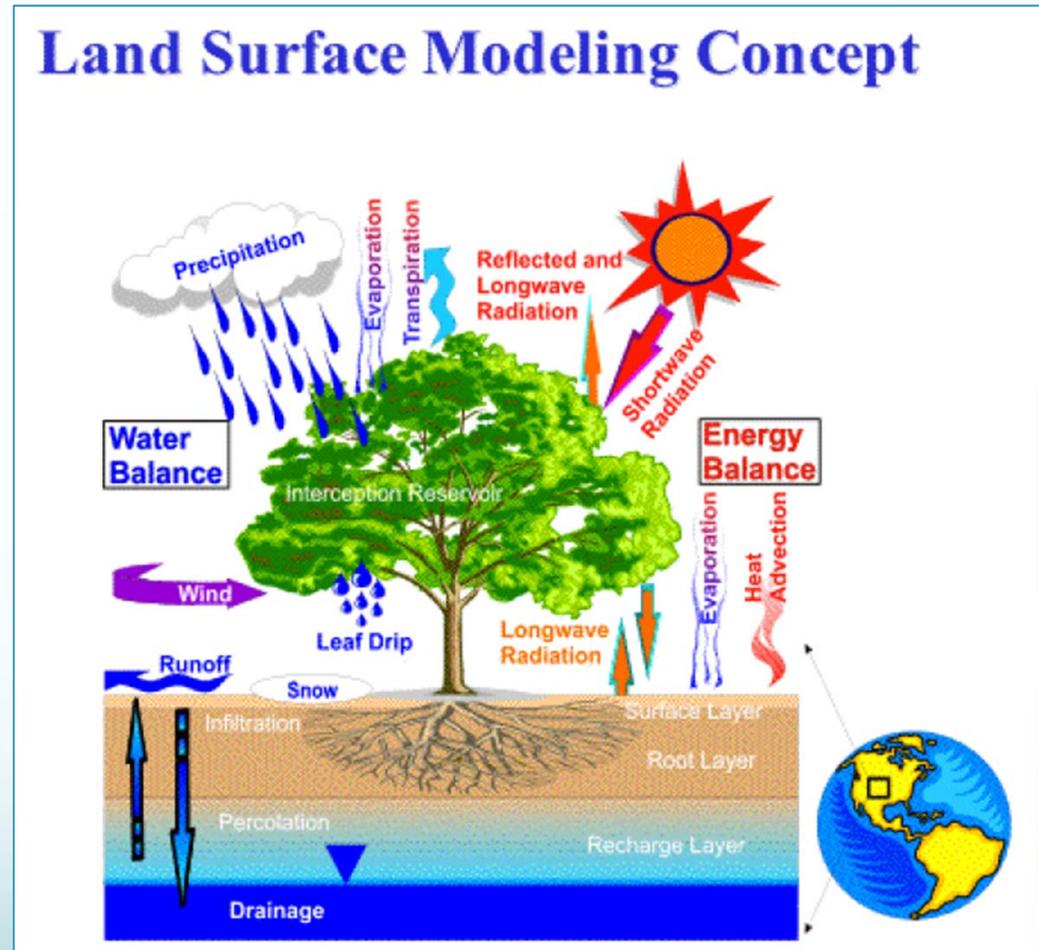

- Developed by Hydrological Sciences Lab

## LIS Capabilities:

- High performance land surface modeling
- Land surface data assimilation
- Allows customized data assimilation for particular applications using standardized interfaces

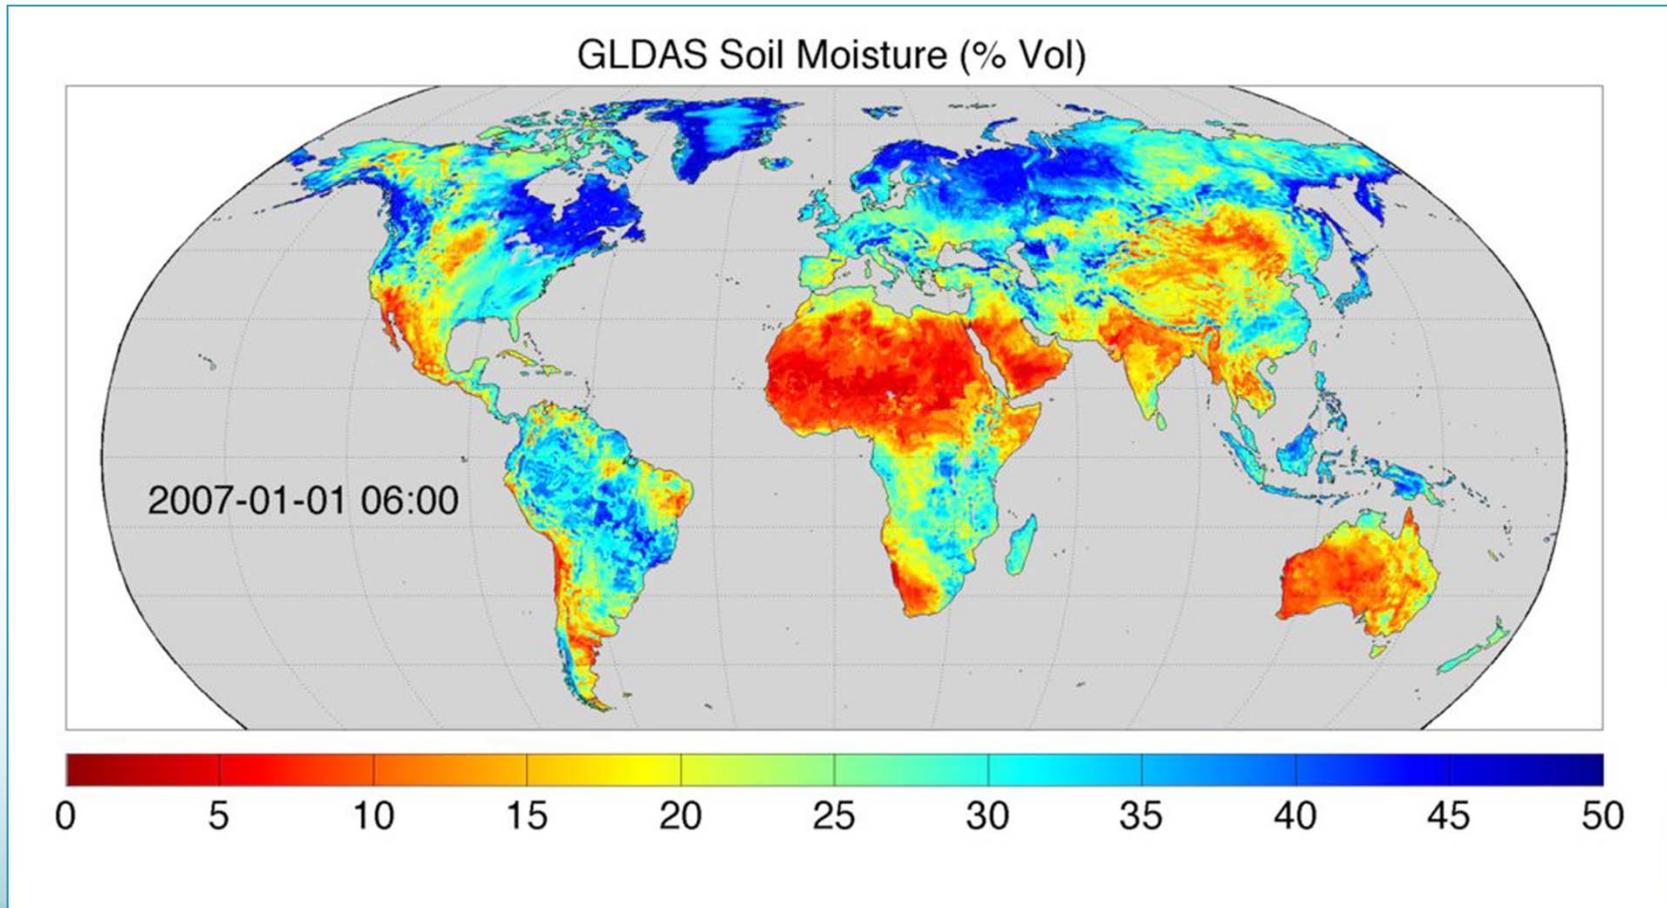

## LIS Operational Application:

- Operational weather forecasts by NOAA/NCEP, AFWA, NASA/GSFC

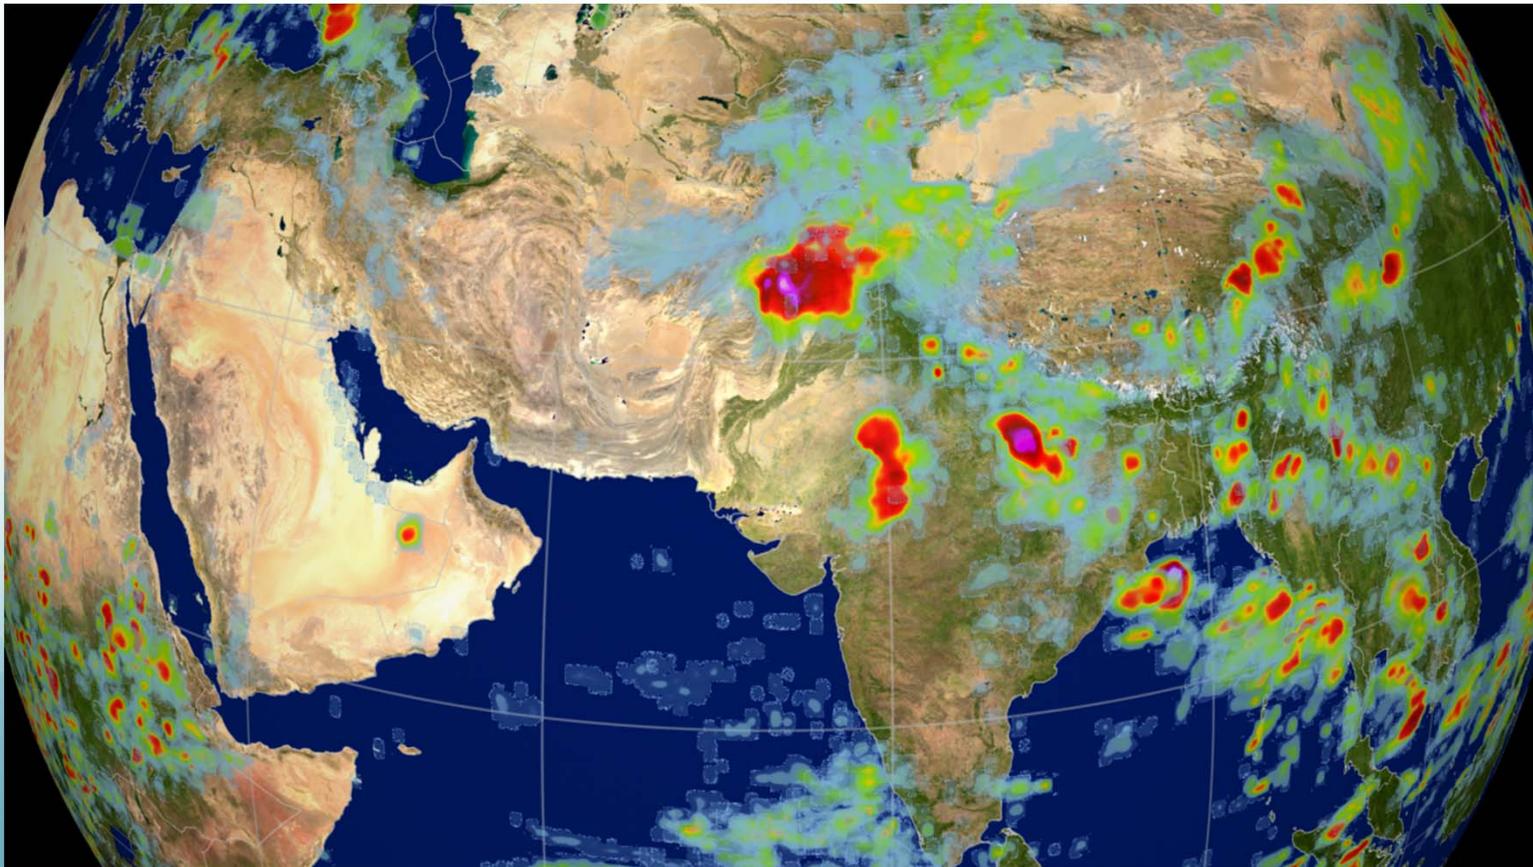

# Soil Moisture products

# Rainfall data from satellites

Real-time rainfall data are being used for flood forecasting, but in many developing countries rain gauging stations are either not available or are too sparsely available to develop representative aerial samples. Satellite-derived rainfall products are useful for flood forecasting.

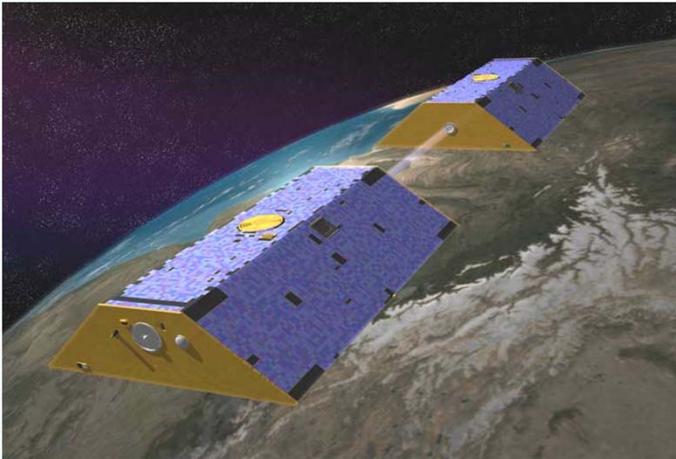

Flooding event in Pakistan and India, 2004

# NASA GRACE\*

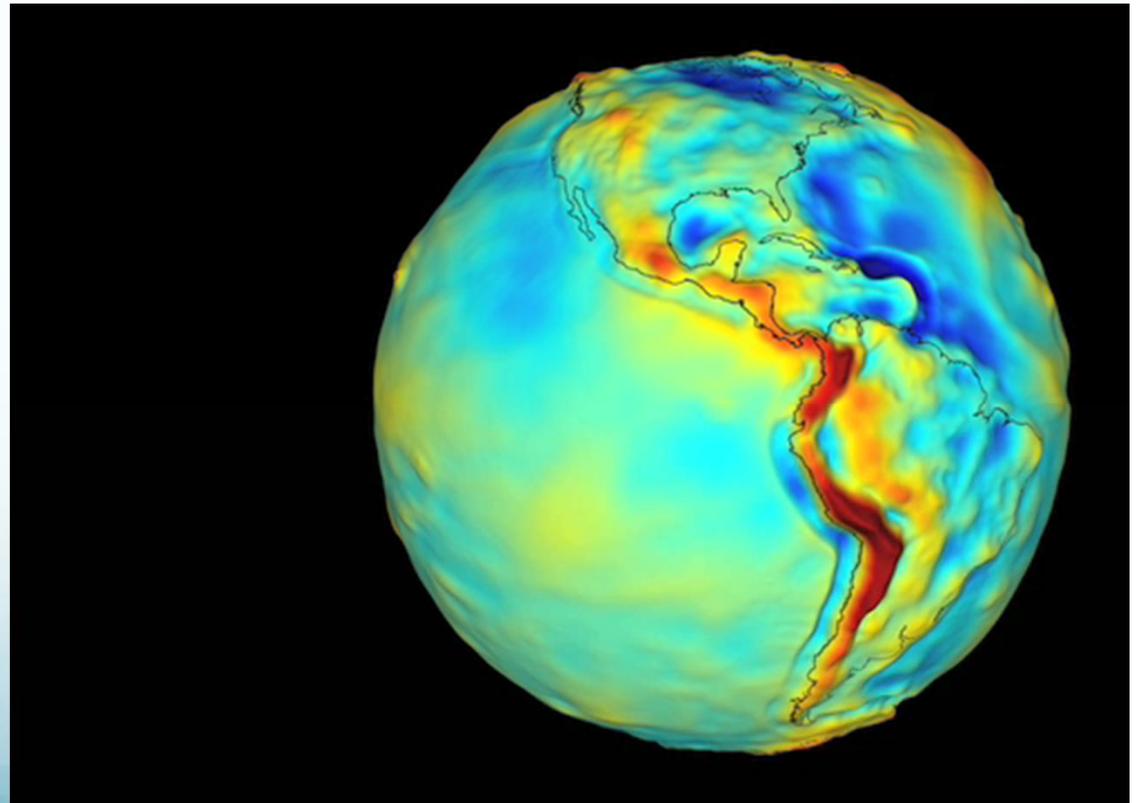

## Gravity Recovery and Climate Experiment

The Gravity Recovery and Climate Experiment measures the Earth gravity field using a pair of satellites.

Earth's gravity field = geology  
+ oceans + ice sheets + soil  
moisture + snow + ground  
water + ...

\* GRACE is a joint partnership between NASA and DLR in Germany.

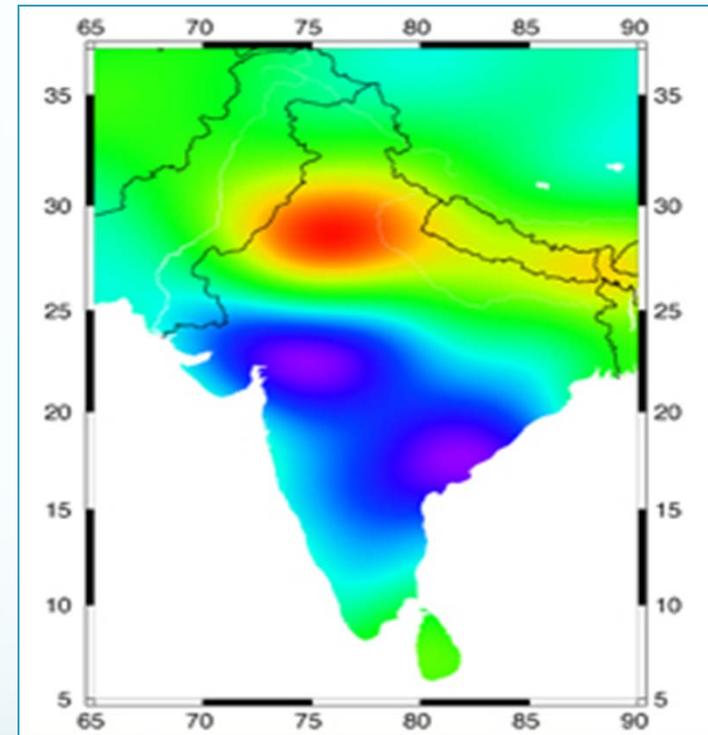

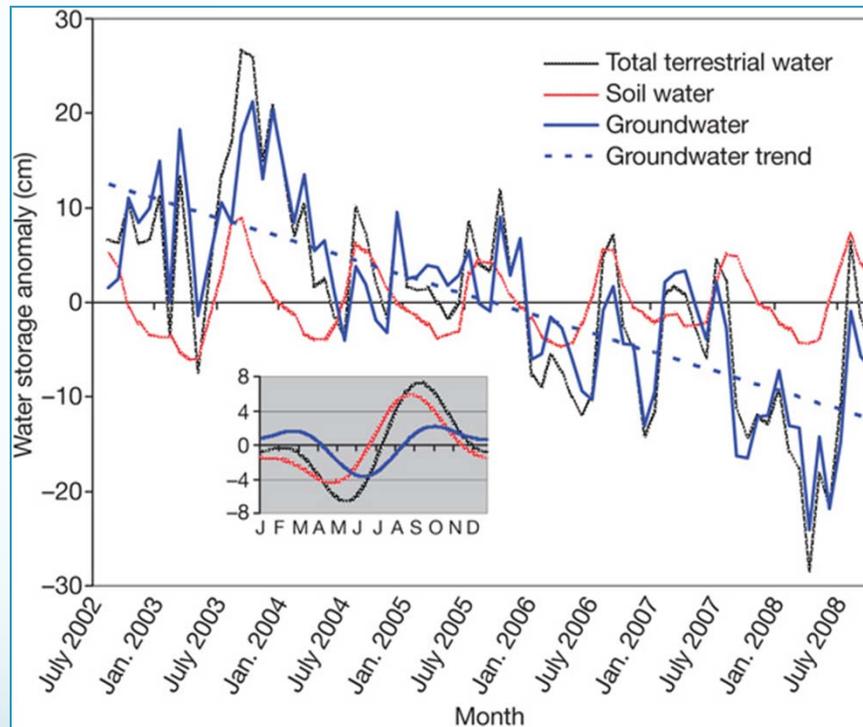

# NASA GRACE\*

## Gravity Recovery and Climate Experiment

India's Disappearing Groundwater: observations by GRACE show regions that are losing centimeters of groundwater each year.

Monthly time series of anomalies of GRACE-derived total TWS, modeled soil-water storage and estimated groundwater storage, averaged over Rajasthan, Punjab and Haryana, plotted as equivalent heights of water in centimeters. Also shown is the best-fit linear groundwater trend. Inset, mean seasonal cycle of each variable. Credit: M. Rodell et al., Satellite-Based Estimates of Groundwater Depletion in India, Nature 460, August 2009

\*Joint with DLR, Germany

# NASA Land Surface Modeling

## LIS Development:

- Developed by Hydrological Sciences Lab

## LIS Capabilities:

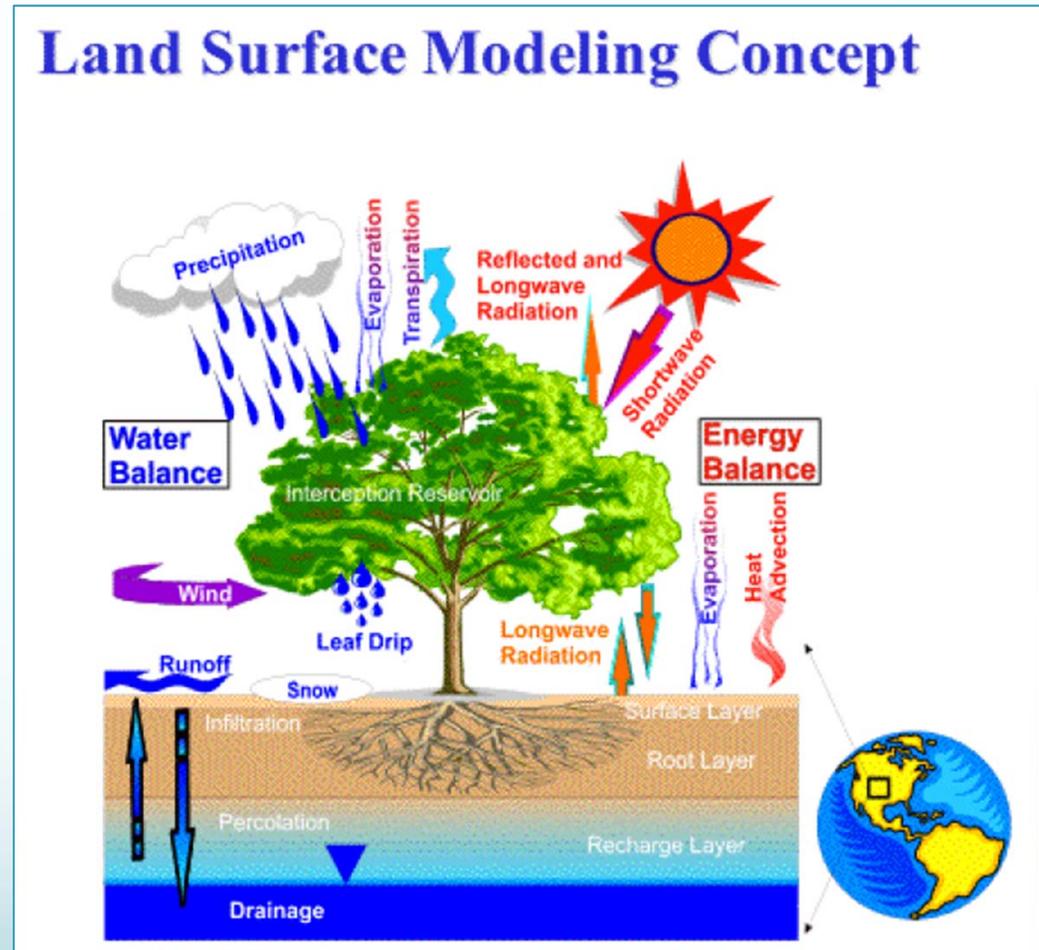

- High performance land surface modeling
- Land surface data assimilation
- Allows customized data assimilation for particular applications using standardized interfaces

## LIS Operational Application:

- Operational weather forecasts by NOAA/NCEP, AFWA, NASA/GSFC

## LIS Couples with Biospheric Data and Models to:

- Evaluate state of biosphere
- Forecast future changes

# Why does NASA do research on food security?

- In 2012, over 40 companies sold the US Government 1.8 million tons and nearly \$1b worth of food for use in its overseas programs
- US food was shipped to at least 48 countries
- NASA can help USAID to better target that assistance, and ensure that the food goes where it is needed, and not where it isn't
- Understanding the impact of drought and floods on food production requires high quality, global data

# The Environment matters...

- Climate variability reduces predictability and increases the likelihood of extreme events
  - Risk of weather-related agricultural impacts growing
  - The need for information that is comparable, timely and global is increasing
- Satellite remote sensing is a starting point for information systems that can warn of abrupt changes to ecosystems
- Global food system is changing
  - Stronger links between food and fuel
  - Changing agriculture policies
  - Increasing use of commodities in investment portfolios
- External shocks from commodity prices, extreme events can have significant negative impact on agriculture and societal well being

# Food Security

**Food security** is the ability of all people to attain and use sufficient food for an active and healthy life.

**Individual:** *Prevalent diseases, malnutrition, care of infants, feeding and food preparation practices, presence of health & sanitation facilities, water supply characteristics, etc...*

**Availability:** *Crop planting date, vegetation or crop condition, amount & timing of rain, drought, market availability of food, public stocks, household stocks, wild food availability, etc...*

**Household/community:** *Local household food crop & animal production, household sales of goods & services, food prices, imports, exports, conditions of other income sources, labor wage rates, food aid, assets, etc...*

From Gary Eilerts, USAID

# Food Availability

**Individual:** *Prevalent diseases, malnutrition, care of infants, feeding and food preparation practices, presence of health & sanitation facilities, water supply characteristics, etc...*

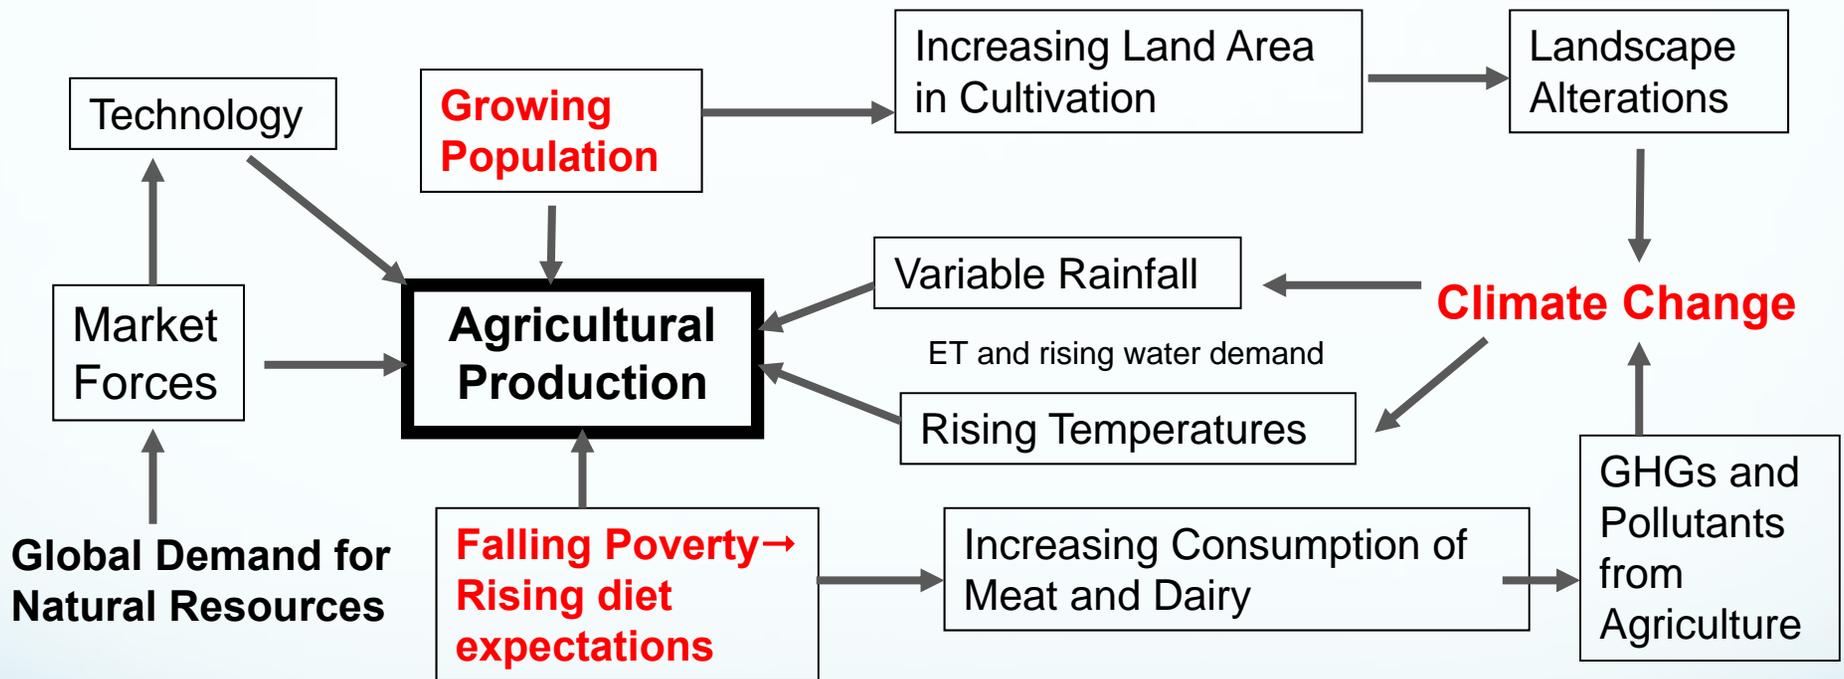

**Availability:** *Crop planting date, vegetation or crop condition, amount & timing of rain, drought, market availability of food, food prices, imports, exports, public stocks, household stocks, wild food availability, etc...*

**Household/community:** *Local household food crop & animal production, household sales of goods & services, conditions of other income sources, labor wage rates, food aid, assets, etc...*

# Availability of Food: *The Challenges*

Advancements in technology are needed to counter the effects of climate change and the demands of growing population and diet expectations.

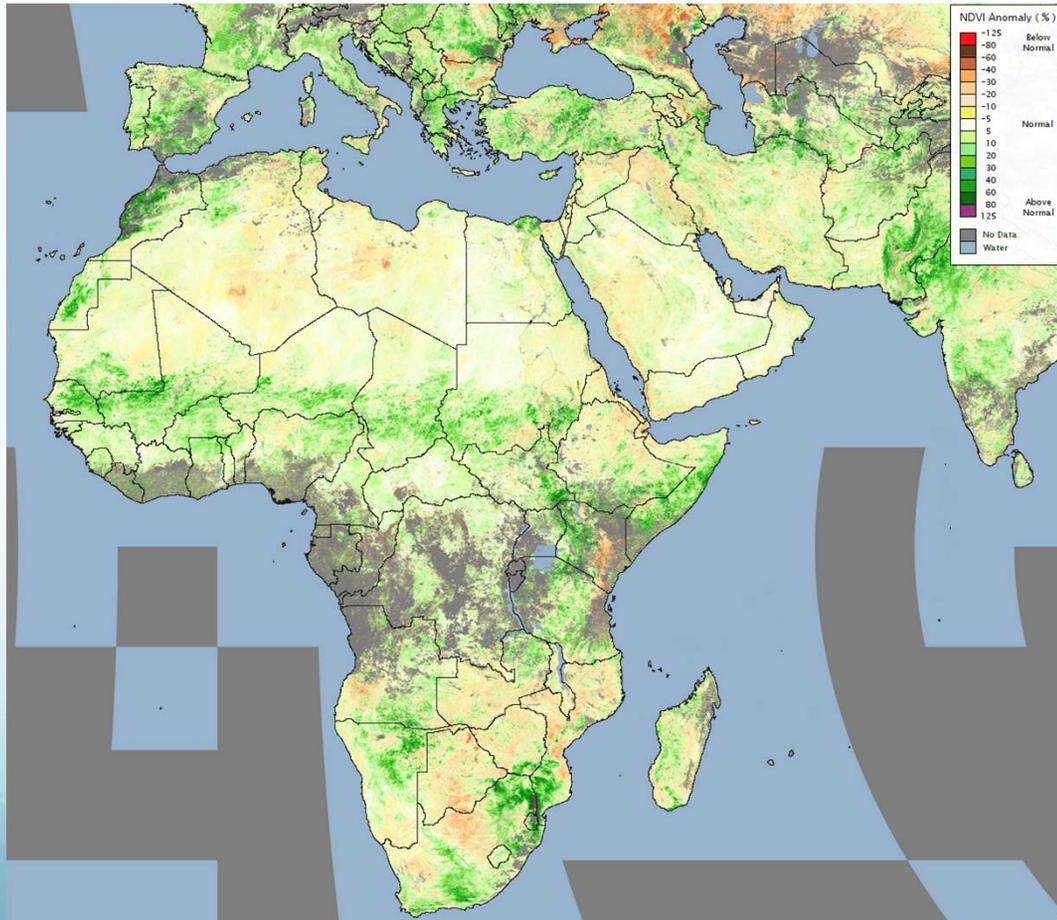

# Availability of Food: *Increased World Food Demand*

- World food demand could double in first half of 21<sup>st</sup> century:
  - 50% increase from world population growth – from 6 to 9 billion – most in least developed countries
  - 50% increase from broad-based economic growth in low income countries
    - *The World Bank has estimated the number of people in developing countries in households with incomes >\$16,000/year will rise from 352 million in 2000 to 2.1 billion by 2030.*
- How many presently low income consumers escape from poverty is the most important determinant of future global demand for food.

# Availability of Food: *Satellite data measure food production and climate*

- Assess food production
- Understand the impact of changes in production on local food prices
- To estimate health outcomes
- To understand what the US Government should do during a crisis

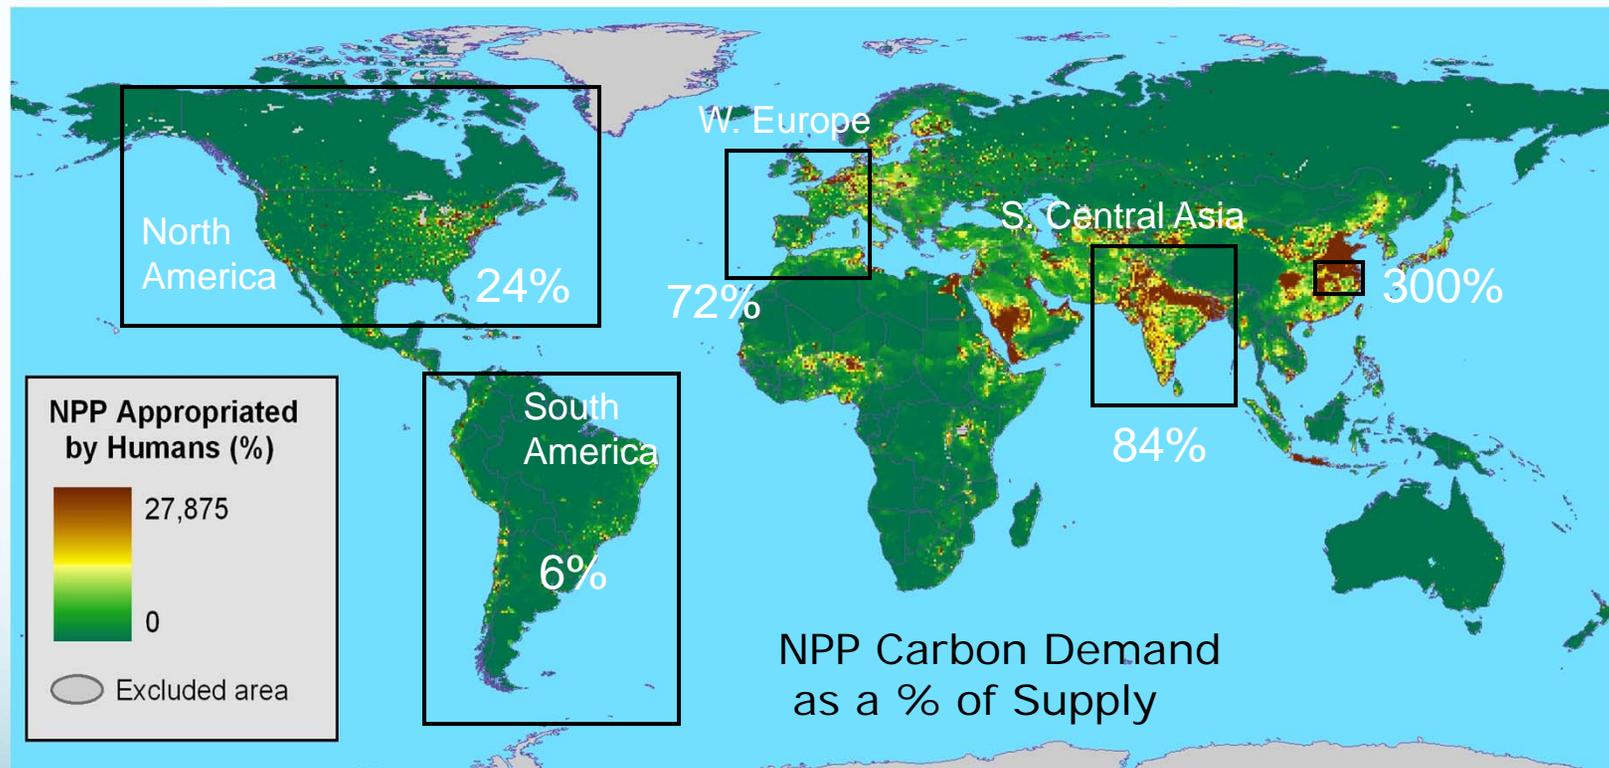

# Global Patterns in Human Consumption of Net Primary Production (NPP)

Global NPP Demand is 11.5 Pg C per year ( 20% of Supply)

There are large regional and local variations

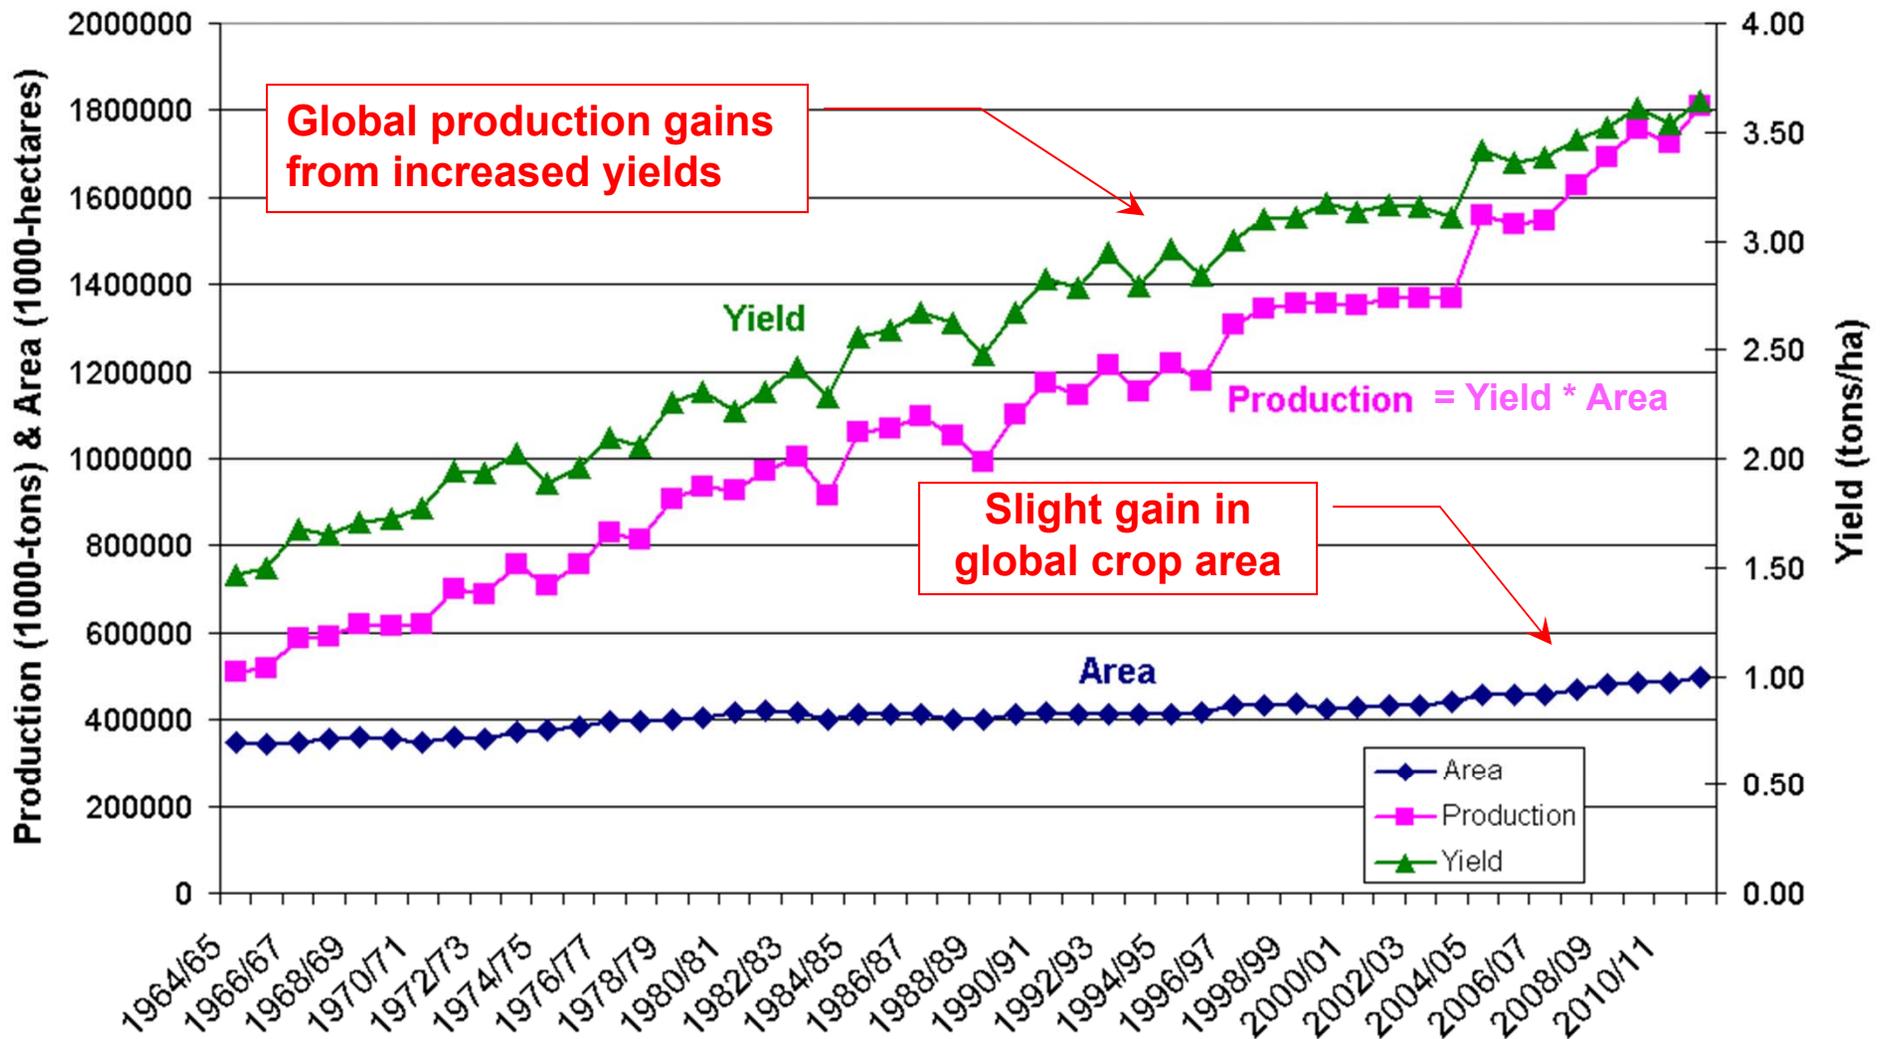

6% (South America) to over 70% (Europe and Asia), and from near 0% (Central Australia) to over 30,000% (New York City, Beijing).

The rate at which humans consume NPP-C is a powerful aggregate measure of human impact on biosphere function.

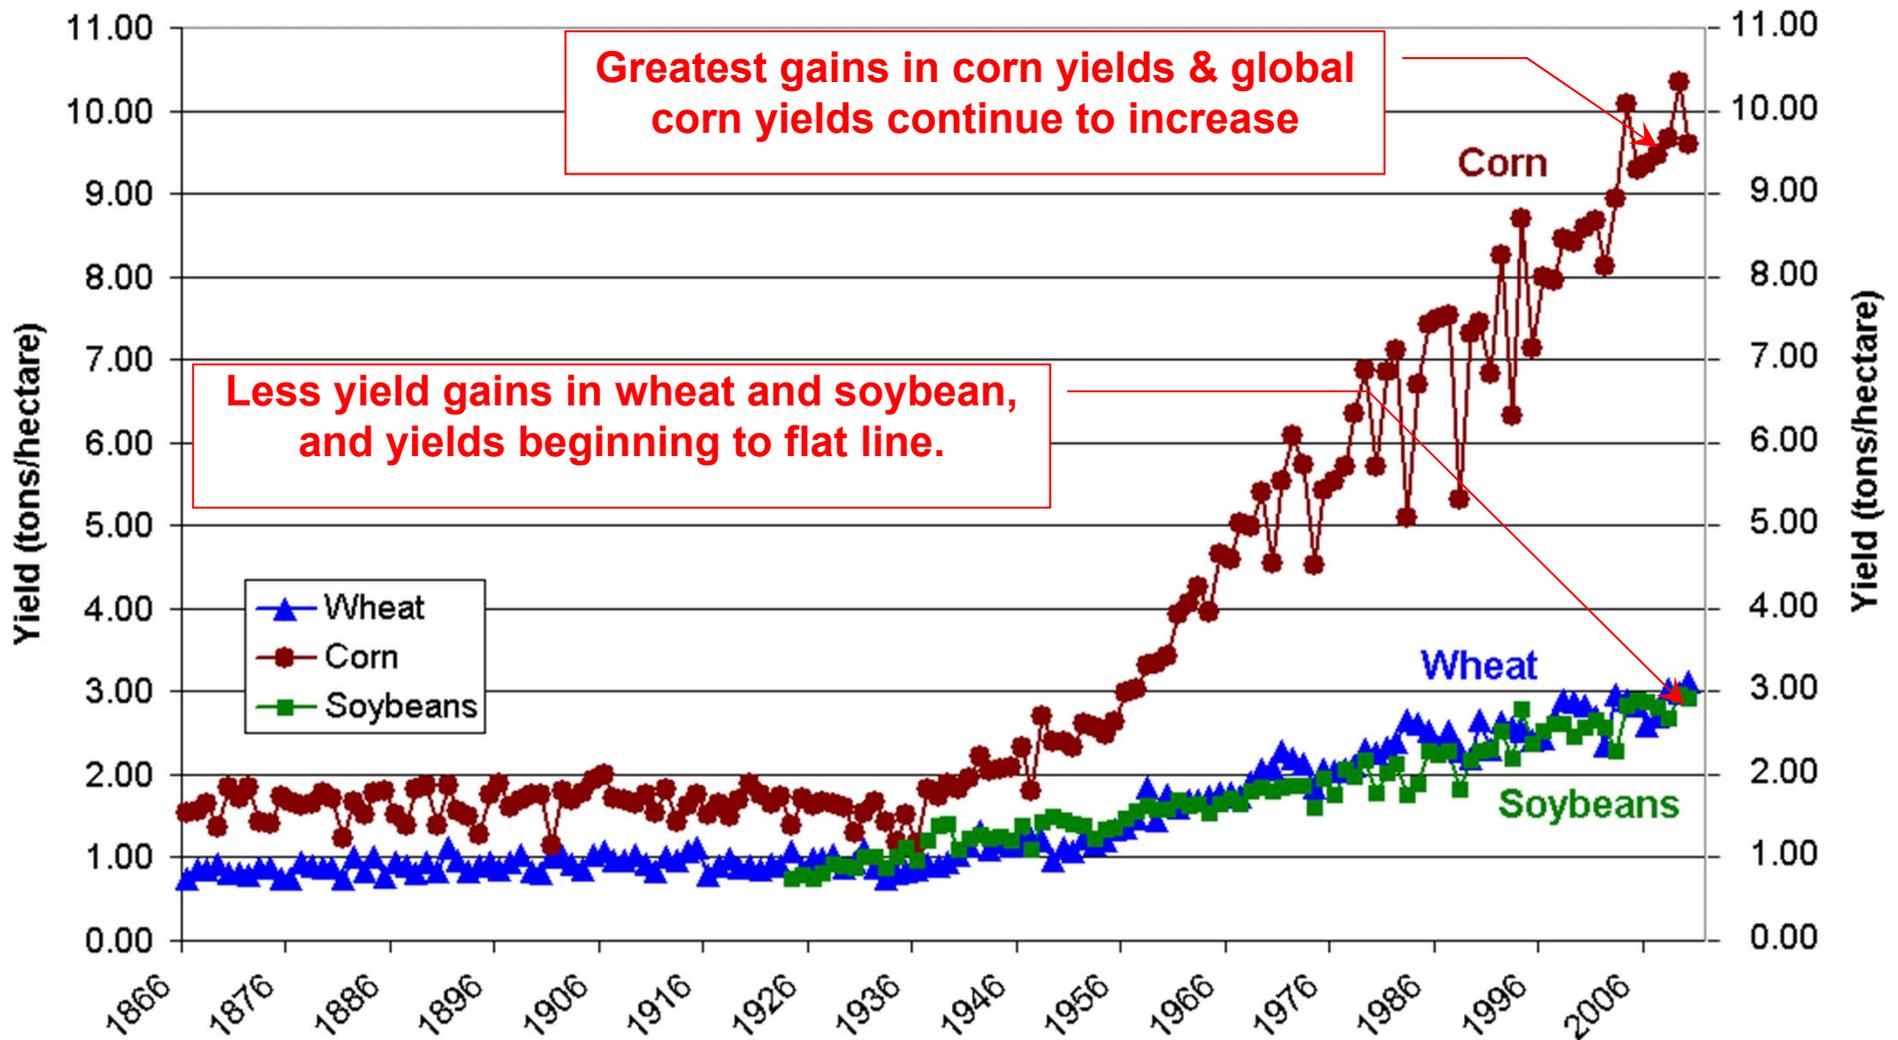

# Global Production, Area and Yield (PAY) (1964-2011) for Wheat, Soybeans & Corn

# Food Access

**Individual:** *Prevalent diseases, malnutrition, care of infants, feeding and food preparation practices, presence of health & sanitation facilities, water supply characteristics, etc...*

**Availability:** *Crop planting date, vegetation or crop condition, amount & timing of rain, drought, market availability of food, imports, exports, public stocks, household stocks, wild food availability, etc...*

**Household/community:** *Local household food crop & animal production, household sales of goods & services, food prices, conditions of other income sources, labor wage rates, food aid, assets, etc...*

From Gary Eilerts, USAID

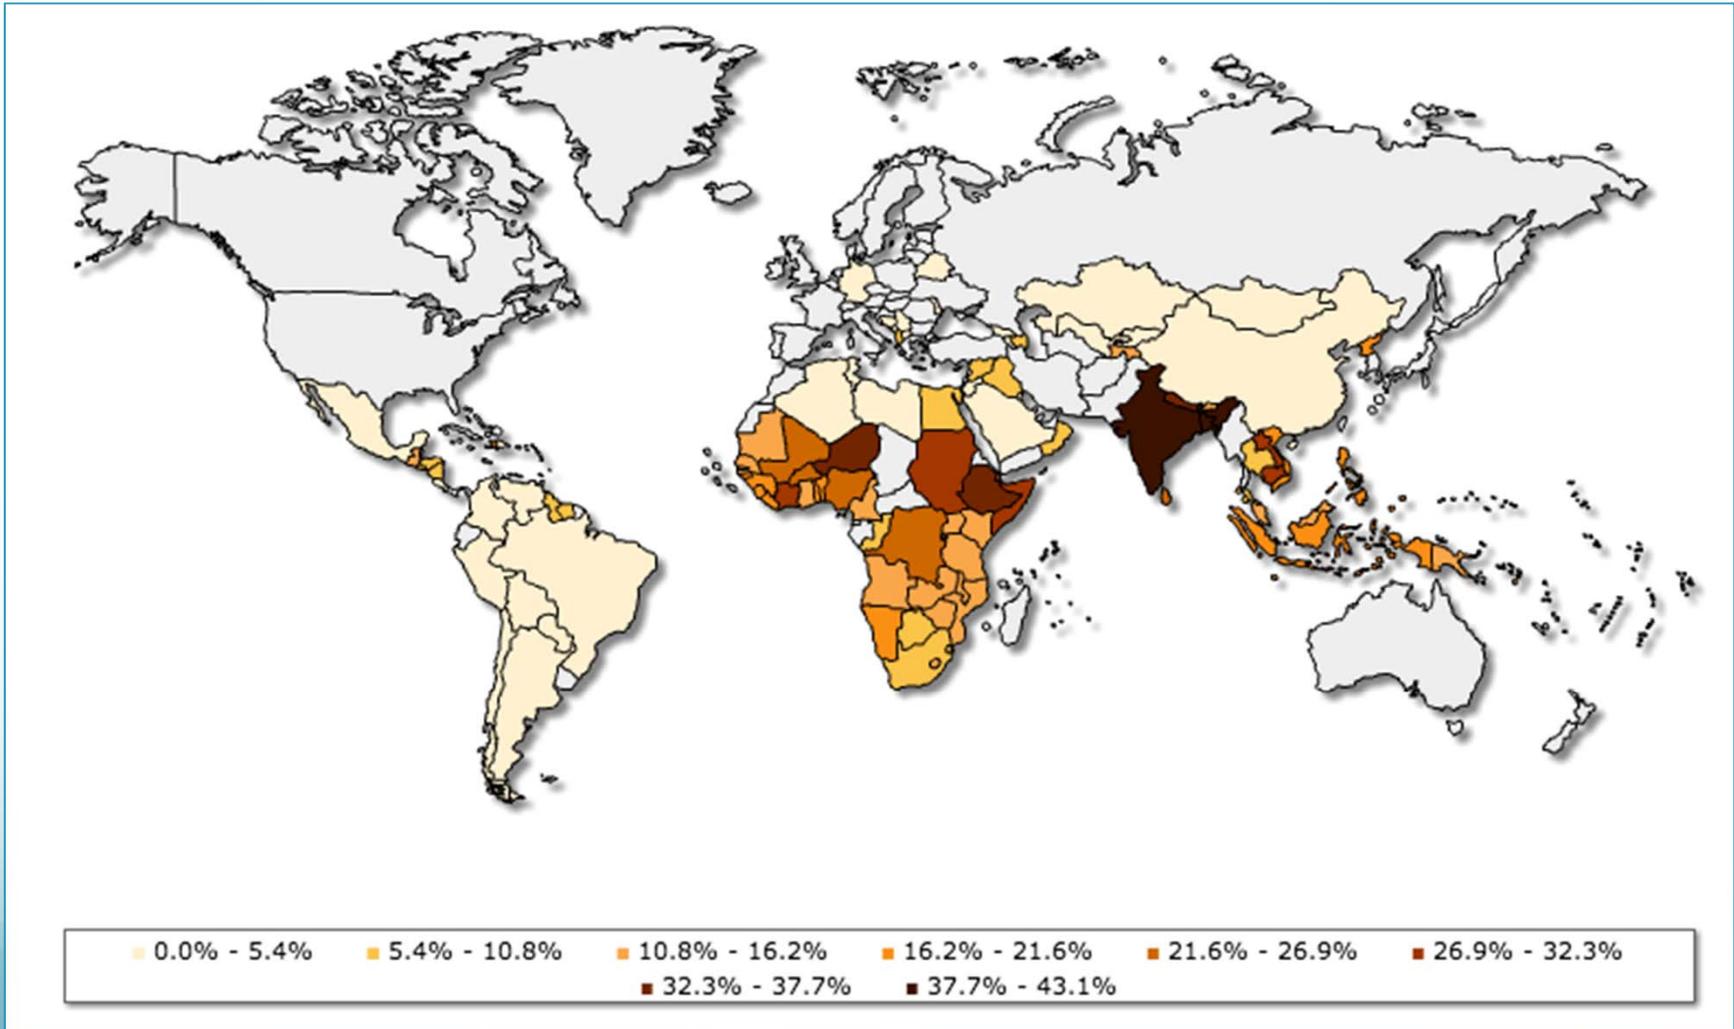

# Poverty Is the Root of Household Food Insecurity and Hunger

- 925 million people suffer under-nutrition or hunger.
- 1.4 billion people live on less than \$1.25 per day; 70% of them are rural, and most of these depend on farming for their meager incomes
- Hunger is due mainly to poverty except in times of war, natural disaster or politically-imposed famine.
- The rich in no country go hungry.
- To solve the world's hunger problem, the world poverty problem must be solved.

# Percent of Malnutrition in Children— poverty metric

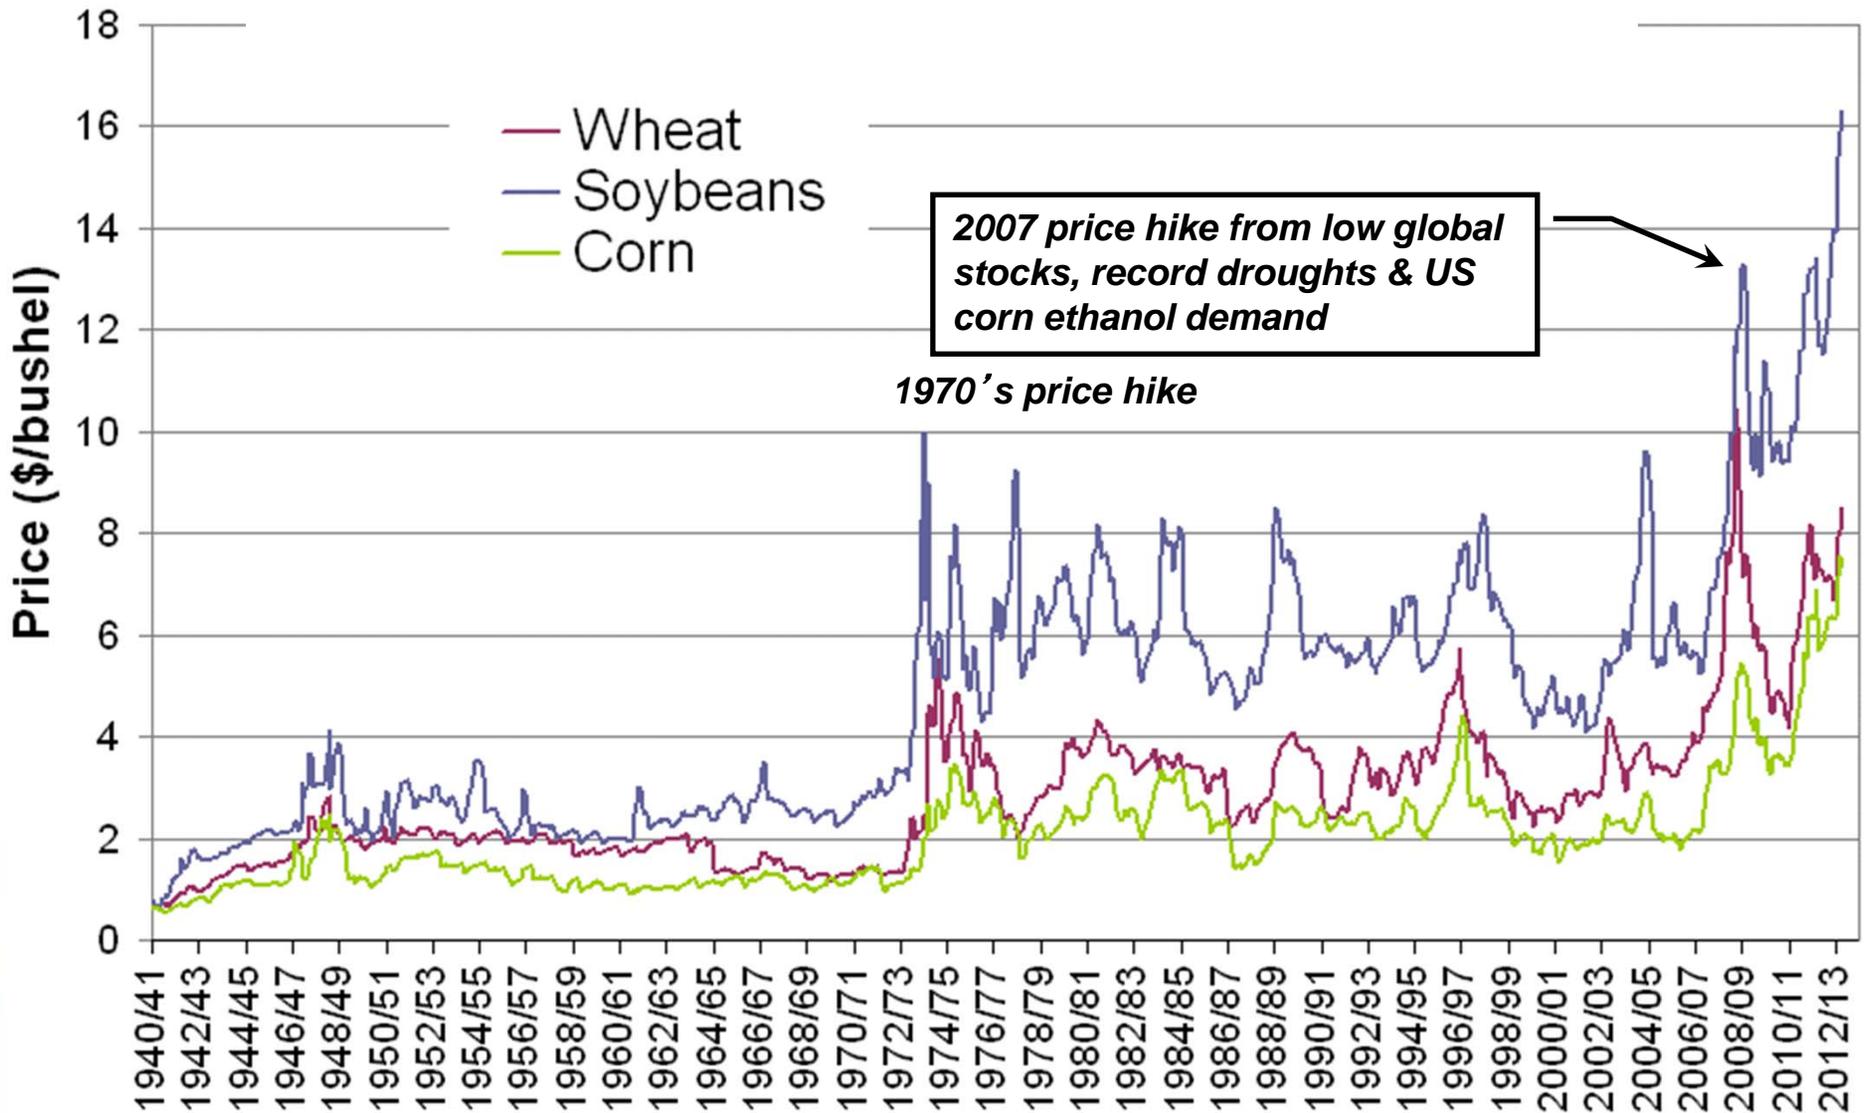

Map from [GlobalHealthFacts.org](http://GlobalHealthFacts.org), data from UN World Health Organization

# High US Producer Prices...

Record soybean(\$17.89/bu) & corn prices (\$8.49/bu)

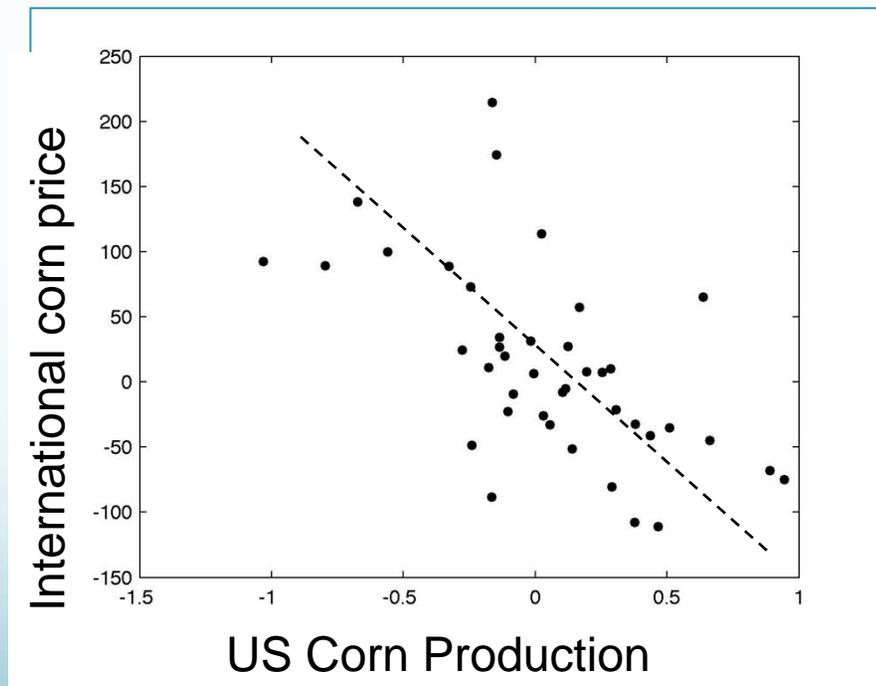

Source: USDA/NASS Agricultural Prices  
[http://www.nass.usda.gov/Charts\\_and\\_Maps/Agricultural\\_Prices/](http://www.nass.usda.gov/Charts_and_Maps/Agricultural_Prices/)

# US Corn production and International corn prices

- US corn production accounts for 30% of the variance of the corn futures, due to the US's extremely large contribution to the world export market.

Maize Production		
Rank	Country	MT
1	United States	314
2	China	193
3	Brazil	70
4	EU-27	65
5	Ukraine	23
	World	874

# Country Isolation metric

Brown et al Applied Geography 2013

Infrastructure that connects this farm  
to a market determines  
its profitability

# Poor infrastructure contributes to food market isolation

# Mapping food price 'pressure points'

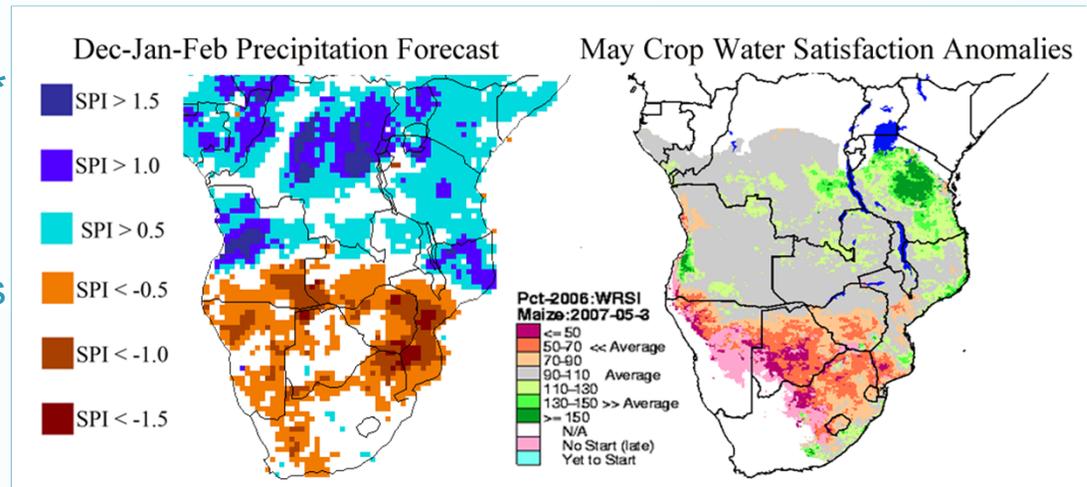

# Famine Early Warning System: Remote Sensing + Models

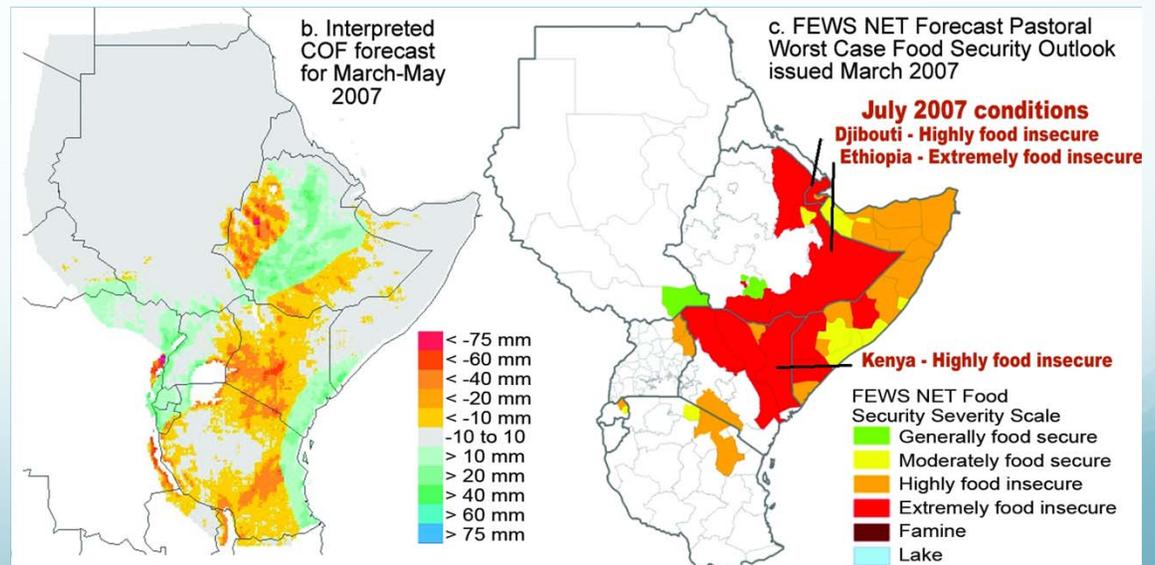

## Famine Early Warning System\*

- biophysical satellite remote sensing
- coupled with models of climate, ecosystem, crop and economic models
- *enables movement of emergency food supplies prior to famine outbreak*

## Global climate model:

- predicts future crop production
- integrate with socio-economic information
- enables estimates of future changes in food security for response planning
