Advanced Seal Sessions I & II

Dr. Bruce M. Steinetz, General Chair
Mr. Patrick H. Dunlap, Structural Seals Co-Chair
NASA Glenn Research Center

Dr. Neelesh Sarawate
Turbine Seals Co-Chair
GE Global Research Center

49th AIAA/ASME/SAE/ASEE
Joint Propulsion Conference, San Jose, CA
July 16, 2013
Outline

Turbine Seals
• Why work advanced seals?
  – NASA engine/propulsion technologies NASA N+3 Studies
  – Challenges
• Advanced concepts under development
  – NASA Glenn
  – GE Global Research

Spacecraft Seals
• Habitable volume seals
• Thermal Barrier seals
Turbine Seals

Aircraft Timeline

- **1903**: DC-3
- **1930s**: B-707
- **1950s**: B-787
- **2000s**: [Future aircraft model]
System improvements require advances in propulsor and core technologies.

Core technologies:
- improved internal aerodynamic
- higher operating temperature
- control of parasitic losses
Why Seals?

- Seals provide high return on technology $ investment
- Same performance goals possible through modest investment in the technology development
  - Example: 1/5th to 1/4th cost of obtaining same performance improvements of re-designing/re-qualifying the compressor

**NASA Study Results: Expected Seal Technology Payoffs**

Engine/Propulsion Technologies from NASA N+3 Studies

- High OPR, high T4 cycle
  - CMC Turbine Blades/Vanes
  - high temp disk material
  - improved seal design
  - intercooled compressor

- High Efficiency Small Cores
  - mitigate efficiency decrement
  - active clearance control
  - flow control

Goal-Driven Advanced Concepts (N+3)
Turbine Seals: Challenges

- Minimize leakage to enable: reduced fuel consumption and emissions
- High temperatures: 1200 to 1500°F
- Minimize heat generation
- High speeds 1000 to 1500 fps
- Moderate pressure 250 psi
- Operate with little or no wear for long life >20,000 hrs
- Occupy small “footprint”
GRC Non-contacting Finger Seals

Key benefits are …

- **Avoids wearing out parts**: No contact avoids wear found in brush seals and labyrinth seals
- **Reduced flow**: <1/3 the flow of a straight tooth labyrinth seal and <1/2 the flow of a contacting brush seal
- **Comparable power loss**: Power loss is the same order of magnitude as brush and finger seals
GE Global Research

Neelesh Sarawate
GE Global Research
GE Global Research: Advanced Sealing Synergy

GE Global Research Center
• First industrial R&D lab
• Established in 1900
• Nearly 180 research labs
• ~2,000 technologists, 2/3rd hold PhDs

Aircraft engines
• High temp & creep
• Limited space
• High speed, swirl ratio
• Seal stability

Gas turbines
• Longer life
• Field installation, assembly
• Large interference

GE Global Research
• Fundamental research
• Seal design & analysis
• Validation tests in custom rigs

Steam turbines
• Rotor dynamics
• Short cycles
• Low-cost
• Rub tolerant
GE Sealing & Performance Technologies

- Brush seals
- Cloth seals
- Aspirating seals
- Abradable coatings
- Non-metallic brush seals
- Retractable seals
- Compliant plate seals
Types of Seals

• **Habitable volume seals**
  – Seals for hatches, windows, docking interfaces, penetrations/ feed-throughs
  – Require extremely low leak rates to ensure that astronauts have sufficient breathable air for extended missions
  – Typically made of elastomer materials

• **Thermal barrier seals**
  – Seals for interfaces in vehicle thermal protection systems (TPS)
  – Must withstand extreme heating during re-entry
  – Typically made of high temperature fibers, wires, or insulating materials
Potential Missions

- Asteroid retrieval mission
- Future space station (e.g., cislunar)
- Lunar/Mars outpost
Habitable Volume Seals
<table>
<thead>
<tr>
<th>Specification</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>Low leakage</td>
<td>Near hermetic levels (~0.002 lb\textsubscript{m} air/day)</td>
</tr>
<tr>
<td>Space environments</td>
<td>Resist damaging effects of atomic oxygen, UV radiation, ionizing radiation, MMOD</td>
</tr>
<tr>
<td>Resiliency</td>
<td>Exhibit acceptable compression set vs. cycling and re-mate after long term holds</td>
</tr>
<tr>
<td>Temperature</td>
<td>Survival: -65 to +100°C (-85 to +212°F) Operational: -50 to +75°C (-58 to +167°F)</td>
</tr>
<tr>
<td>Loads</td>
<td>Low compression and adhesion loads</td>
</tr>
<tr>
<td>Androgynous docking</td>
<td>Design for seal-on-seal operation for vehicle-to-vehicle craft emergency rescue</td>
</tr>
<tr>
<td>Fault tolerance</td>
<td>Include multiple seals/bulbs for redundancy</td>
</tr>
<tr>
<td>Surface operations</td>
<td>Exhibit robust operation in presence of dust, FOD, etc.</td>
</tr>
</tbody>
</table>
NASA Docking System

- NASA implementation of the International Docking System Standard (IDSS)
- Under development as a common docking system for a variety of host vehicles
- Requires a large (~51” diameter) near hermetic seal to prevent loss of cabin air
- Operate in either of following modes:
  - Seal-on-Flange
  - Seal-on-Seal (androgynous)
Potential NDS Applications

- MPCV/Orion
- Space-X Dragon
- Boeing CST + Bigelow BA330
- Sierra-Nevada Dream Chaser
Advanced Habitat + Rover Seals

- Rover Docking Interface/Seal
- Hatch/Seal
- Suit Port Seal
Advanced Habitable Volume Seals for Space Environments

- Seals with UV-resistant coatings
- Seals with additives for UV resistance
- Seals with retractable “shrouds”
Thermal Barrier Seals
**Thermal Barrier Seal Challenges**

| **Temperature**                | Near term missions: 2600°F with short (<1 min.) exposures to 3200°F for single heating pulse  
|                               | Far term missions: 2600°F with longer (2-3 min.) exposures to 3200°F for multiple heating pulses (e.g., Mars re-entry/return) |
| **Leakage**                    | Prevent excessive heat flow to underlying structures |
| **Space environments**        | Resist damaging effects of atomic oxygen, UV radiation, ionizing radiation, MMOD |
| **Resiliency**                | Maintain contact with adjacent sealing surfaces; exhibit acceptable compression set vs. cycling |
| **Loads**                     | Exhibit light loads to prevent damage to TPS tile surfaces |
| **Durability**                | For dynamic interfaces, tolerate scrubbing with minimal damage or loss of performance |
Advanced Thermal Barrier Seals

Use of advanced high temperature fibers

Advanced seal preloaders for improved resiliency at high temperatures
Agenda Information
10:00 am Oral Presentation: Overview of Advanced Seals Challenges and Opportunities

Bruce M. Steinetz and Patrick H. Dunlap, NASA Glenn Research Center; Neelesh Sarawate, GE Global Research Center

10:30 am Oral Presentation: Turbomachinery Sealing Technology- Survey of Past Success and Strategy for Future Development

Joel Kirk, GE Aviation

11:00 am: Design, Manufacture and Testing of Variable Bristle Diameter Brush Seals (AIAA- 2013-3859)

11:30 am: A Novel Air/Oil Separator and Its Integration to a Prototype Miniature Jet Engine (AIAA- 2013-3860)

Emre Tan Topal, TUSAS Engine Industries Inc; Sercan Acarer, TEI TUSAS Engine Industries Inc./Izmir Institute of Technology; Tuna Kirgiz, TEI TUSAS Engine Industries Inc.
1:00 pm Oral Presentation: Characterizing Multi-Scale Viscoelasticity of Polymers: A Transient Sealing Perspective  
Azam Thatte, GE Global Research

1:30 pm: Transient Simulations of Rotordynamic Problems with Whirling Motion (AIAA-2013-3914)  
Chandrasekhar Kannepalli, Vineet Ahuja, and Ashvin Hosangadi, Combustion Research and Flow Technology, Inc. (CRAFT Tech)

2:00 pm: Use of VUV Radiation to Control Elastomer Seal Adhesion (AIAA-2013-3915)  
Henry C. de Groh III, Bernadette J. (“Sue”) Puleo, and Deborah L. Waters, NASA Glenn Research; Presented by Sue Puleo
