* Projected benefits once technologies are matured and implemented by industry. Benefits vary by vehicle size and mission. N+1 and N+3 values are referenced to a 737-800 with CFM56-7B engines, N+2 values are referenced to a 777-200 with GE90 engines.

** ERA’s time-phased approach includes advancing “long-pole” technologies to TRL 6 by 2015.

‡ CO2 emission benefits dependent on life-cycle CO2e per MJ for fuel and/or energy source used.

Research addressing revolutionary far-term goals with opportunities for near-term impact
N+3 Advanced Vehicle Concept Studies Summary

Advanced concept studies for commercial subsonic transport aircraft for 2030-35 Entry into Service (EIS)

Trends:
- Tailored/multifunctional structures
- High aspect ratio/laminar/active structural control
- Highly integrated propulsion systems
- Ultra-high bypass ratio (20+ with small cores)
- Alternative fuels and emerging hybrid electric concepts
- Noise reduction by component, configuration, and operations improvements

Advances required on multiple fronts…
Fixed Wing Project Research Themes
Based on Goal-Driven Advanced Concept Studies

|---------------------|--------------------------|-----------------------------|-----------------------------------|-----------------------------------|

Goal-Driven Advanced Concepts (N+3)

1. Lighter-Weight Lower Drag Fuselage
2. Higher Aspect Ratio Optimal Wing
3. Quieter Low-Speed Performance
4. Cleaner, Compact Higher BPR Propulsion
5. Hybrid Gas-Electric Propulsion
6. Unconventional Propulsion Airframe Integration
7. Alternative Fuel Emissions

Research Themes with Investments in both Near-Term Tech Challenges and Long-Term (2030) Vision
Lighter-Weight, Lower-Drag Fuselage

**Objective**

Explore and develop structural technology concepts enabled by emerging advanced manufacturing capability to directly reduce aircraft operating empty weight

**Technical Areas and Approaches**

**Tailored Load Path Structure**
- Curvilinear, metallic stiffeners
- Tow-steered carbon fiber

**Benefit/Pay-off**
- 15% fuselage structural weight reduction relative to conventional composite structure
- Validated design methodology can be applied immediately and will be applicable to future designer materials for greater benefit
**Higher Aspect Ratio Optimal Wing**

**Objective**
Explore and develop aerodynamic, structural, and control technologies to expand the optimal wing system drag vs. weight design trade space for reduced energy consumption.

**Technical Areas and Approaches**

**Tailored Load Path Structure**
- Passive aeroelastic tailored structures

**Active Structural Control**
- Distributed control effectors, robust control laws
- Actuator/sensor structural integration

**Aerodynamic Shaping**
- Low interference external bracing
- Passive wave drag reduction concepts

**Active Flow Control**
- Transonic drag reduction; mechanically simple high-lift

**Adaptive Aeroelastic Shape Control**
- Continuous control effector(s) for mission-adaptive optimization

**Benefit/Pay-off**
- 20% wing structural weight reduction
- Wave drag benefits tradable for weight or other parameters
- Concepts to control and exploit structural flexibility
- Optimal AR increase up to 50% for cantilever wings, 100% for braced wings

*Fixed Wing Project*
*Fundamental Aeronautics Program*
**Problem**

Conceptual design of Truss-Braced Wing (TBW) SUGAR High configuration during the N+3 phase 1 study showed that the TBW had significant potential to contribute to meeting NASA N+3 goals but also highlighted a significant uncertainty in the wing weight estimate.

**Objective**

Refine the SUGAR High configuration and reduce the uncertainty in estimates of the potential benefits of TBW technology with specific focus on reducing wing weight uncertainty.

**Approach**

Create a detailed finite element model (FEM) of SUGAR High configuration to provide a higher fidelity weight estimate of the concept and validate the FEM via a transonic aeroservoelastic test in the LaRC/Transonic Dynamics Tunnel (TDT).

**Results**

FEM completed and provides the higher fidelity wing weight estimates desired. 1) SUGAR High fuel burn significantly improves, 2) SUGAR High fuel burn over Refined SUGAR gets better, and 3) an unducted fan variant of SUGAR High may approach the N+3 goal.

**Significance**

The TBW concept remains a viable, multidisciplinary concept to reduce transport aircraft energy consumption. The FEM provides the basis for a TDT test to validate the structural model and gives confidence to begin planning for a high-fidelity aerodynamic design/analysis targeted at a low-interference truss integration.
**Objective**
Explore and develop aero-structural-acoustic technologies to directly reduce perceived community noise with minimal or no impact on performance.

**Technical Areas and Approaches**

**Airframe Noise**
- Flap and slat noise reduction concepts
- Landing gear noise reduction concepts

**Acoustic Liners and Duct Propagation**
- Multi-degree-of-freedom, low-drag liners

**Benefit/Pay-off**
- 12 dB cum noise reduction
- Liner and non-active-flow-control high-lift system technology have early insertion potential
Test of Advanced MDOF Liner

**Objective**
Develop design processes and liner technology implementations to address aft directed broadband noise.

**Approach**
A novel variable impedance and variable depth liner designed at LaRC and tested in GRC’s Advanced Noise Control Fan (ANCF) rig. Liner manufactured by Hexcel Corporation. A conventional two-degrees of freedom liner served as the benchmark.

**Results**
Results indicate improved broadband performance for the variable impedance liner. Valuable insights have been gained for follow-on high-speed testing (TRL 5).

**Significance**
Increased confidence in design tools and the efficacy of the variable depth liner concept.

**Research Team:** Dan Sutliff (GRC), Michael Jones (LaRC), Douglas Nark (LaRC)
Objective
Explore and develop technologies to directly enable efficient, clean-burning, fuel-flexible combustors compatible with high OPR (50+) gas-turbine generators.

Technical Areas and Approaches
Fuel-Flexible Combustion
  – Injection, mixing, stability

Benefit/Pay-off
  – Low emissions: NOx reduction of 80% at cruise and 80% below CAEP6 at LTO and reduced particulates
  – Compatible with thermally efficient, high OPR (50+) gas generators
  – Compatible for gas-only and hybrid gas-electric architectures
  – Compatible with ducted or unducted propulsors
Cleaner, Compact, Higher Bypass Ratio Propulsion
Compact, High OPR Gas Generator

Objective
Explore and develop material, aerodynamic, and control technologies to enable compact gas-turbine generators with high thermal efficiency to directly reduce fuel consumption.

Technical Areas and Approaches
Hot Section Materials
- 1500F disk & coatings
- 1500F capable non-contacting seal

Tip/Endwall Aerodynamics
- Minimize losses due to short blades/vanes
- Minimize cooling/leakage losses

Benefit/Pay-off
- Advanced compact gas-generator core architecture and component technologies enabling BPR 20+ growth by minimizing core size
- Thermally efficient, high OPR (50+) engines

Tip/Endwall aerodynamic loss mitigation

1500 F, bonded hybrid disk concept

Wu et al., Exp. Fluids, 2010, 1011
Compressor Tip Clearance/Endwall Flow Research (Johns Hopkins U. & Purdue U.)

**Objective**
Gain physical insights into loss mechanisms associated with large compressor tip clearance gaps to guide and test loss mitigation concepts.

**Approach**
Obtain detailed data and CFD simulations for tight and increased tip clearance gaps to measure performance impact and loss mechanisms. Johns Hopkins University (JHU) rig made of acrylic operating in NaI mixture renders casing and blades optically transparent. This is a unique capability.

**Results**
All hardware fabricated and installed. Data acquisition in progress.

**Significance**
Mitigating tip clearance loss of aft stages of small high pressure compressor will enable higher bypass ratio fans and increased thermal efficiency.

**Research team:** Prof. Nicole Key (Purdue), Mark Celestina (GRC), Prof. Joe Katz (JHU), Chunill Hah (GRC)
Turbine Tip Clearance/Endwall Flow Research (Honeywell, Pratt & Whitney, Naval Academy)

Objective
Gain physics insight of large tip clearance gap leakage flow losses and hub seal cavity hot-gas re-ingestion to minimize loss and cooling flow requirements.

Approach
Obtain detailed data and CFD simulations for increasing tip clearance gaps and tip treatments to measure performance impact and loss mechanisms. Understand impact of seal cavity design parameters on minimizing hot gas reingestion and cooling requirements.

Results
All hardware fabricated and installed. Data acquisition in progress.

Significance
Mitigating tip clearance/endwall loss of smaller gas generator turbine stages will enable increased fan bypass ratio and improved thermal efficiency.

Research team: J. Christophel (P&W), Ashlie McVetta (GRC), M. Malak (Honeywell), Phil Poinsatte (GRC), R. Volino (Naval Academy), David Ashpis (GRC)
**Objective**
Explore and develop electric system materials and increase the power density of an electric motor contributing to game-changing hybrid gas-electric propulsion

**Technical Areas and Approaches:**

**Electric System Materials**
- Low ac loss superconducting materials
- Multifunctional structures integrating power system

**Electric Components**
- High power density superconducting motor
- High power density non-cryogenic motor

**Benefit/Pay-off:**
- Will help enable the paradigm shift from gas to hybrid gas-electric propulsion
- Hybrid gas-electric propulsion will help reduce energy consumption, emissions, and noise
High Fidelity Sizing Model for Superconducting Rotating Machines for Turboelectric Propulsion Design” (AML NRA)

Objectives
• Accurate predictions of weights and efficiencies of superconducting machines
• Higher fidelity AC loss models for superconducting stators

Approach
• Replace current sheet field approximations with exact field calculations
• Develop AC loss models for combined pulsating and rotating magnetic fields
• With DoE, build new AC loss facility at CAPS/FSU to validate the loss models

Results
New fully superconducting motor model developed incorporating AC losses from rotating fields, pulsating fields and transport current

Significance
Much greater confidence in the design of fully superconducting motors. New loss models and AC loss facility will guide future superconductor motor development

Other Partners: Center for Advanced Power Systems (CAPS); Department of Energy (DoE); Florida State University (FSU)
Unconventional Propulsion Airframe Integration
Integrated BLI Systems

Objective
Explore and develop technologies to enable highly coupled, propulsion-airframe integration that provides a net vehicle system-level energy efficiency benefit.

Technical Areas and Approaches

Aerodynamic Configuration
- Novel configurations and installations

Distortion-Tolerant Fan
- Integrated inlet/fan design robust to unsteady and non-uniform inflow

Propulsion Airframe Aeroacoustics
- Noise shielding of integrated installations

Benefit/Pay-off
- Demonstrates a net system-level benefit for BLI propulsion system integration; applicable and beneficial to a variety of advanced vehicle concepts
- Distortion-tolerant fan technology and acoustics characterization relevant to near-term, conventional short-duct installations
Objective
Experimentally assess the benefits of boundary layer ingestion (BLI) for the D8 configuration.

Approach
Obtain experimental data at simulated cruise conditions for the podded and integrated configurations and complement that dataset with computational analysis.

Results
Collected force and moment data, rake surveys of the engine inlet and exit, surface pressures, and surface tuft visualization. Preliminary results indicate a 20-25 drag count reduction for the integrated configuration. This equates to an electrical power savings on the fans of about 5-8%.

Significance
Preliminary results are aligned with design assumptions of D8 configuration

Research Team: MIT/PW/Aurora Team; Greg Gatlin (LaRC); Shishir Pandya (ARC)
Objectives
Explore the potential of alternative fuels to reduce the impact of aviation on air quality and climate, and their impact on performance.

Technical Areas & Approaches
Emission & Performance Characterization
- Flight tests
- Ground tests
- Laboratory tests

Benefit/Pay-off
- Will dramatically reduce the impact of aviation on the environment (gaseous, particulates, and contrails)
- Will support standard-setting organizations by providing important and timely data

Alternative-Fuel Effects on Contrails and Cruise Emissions (ACCESS)

Team Leads: Brian Beaton (Integ. Mgr, LaRC); POCs: Bruce Anderson (LaRC); Dan Bulzan (GRC); Gary Martin (DFRC)
Major Fixed Wing Activities for FY2014

• Acquire **X-56A** flight vehicle from AF after shakedown flight tests and work on developing advanced and open (non-proprietary) control capability

• Conduct **ACCESS-2** flight tests using biofuels and International Partnership

• Conduct **FAST-MAC 2.5** NTF test

• Conduct **Truss-Braced Wing Aeroservoelastic Test** with Boeing at LaRC TDT

• Conduct additional **PAI/BLI Aerodynamic Tests** on MIT/D8 concept at LaRC 14x22

• Optimize passive aeroelastically-tailored CRM wing with AR 14

• Complete final design of **distortion-tolerant fan** for embedded engines and prepare for testing in GRC 8x6 tunnel in FY15

• Solicit and award next round of **NRA** awards
Concluding Remarks

• Addressing the environmental challenges and improving the performance of subsonic aircraft

• Undertaking and solving the enduring and pervasive challenges of subsonic flight

• Understanding and assessing the game changers of the future

• Nurturing strong foundational research in partnership with industry, academia, and other Government agencies
